FIRST, SSI GAVE YOU GALACTIC GLADIATORS. NOW WE BRING YOU GALACTIC ADVENTURES.

When we first introduced GALACTIC GLADIATORS™ — a strategy simulation of cosmic combat — it didn’t take long before it became one of our bestsellers. And no wonder, it had the perfect script crammed with fast-paced action, fun and excitement. Using Hi-Res color graphics, it created an alien setting filled with wild and bizarre creatures shooting it out Western style. Except instead of guns, they’re armed with phaser rifles, laser swords, the Death Touch, and other exotic weapons.

Now we are proud to present its sequel! — GALACTIC ADVENTURES™. More than a game of tactical battles, it is a full-fledged science-fiction, role-playing adventure strategy simulation. It starts out by taking you to a space port of an alien planet. As a stranger in a strange land, you must go into the streets to get combat experience. And what better way than by getting into a few fights? You must also learn assorted Advanced Skills (such as Noetic Logic, Linguistics, Star Piloting, Lockpicking), earn some money and recruit fellow adventurers to join you. Only then can you hope to survive off-worldly forays and eventually achieve the title of Independent Adventurer.

To embark on an adventure, you must apply to one of four guilds, each stressing different Advanced Skills. All of them will send you to different worlds, where who-knows-what awaits you. You may find nothing or you may find treasures. Then again, there may be monstrous creatures just dying to kill, maim or capture your team. If between fleeing and fighting, you choose the latter, you’ll get a complete strategy game of tactical combat.

Unlike other adventure games, this one doesn’t just use a bunch of text to describe the action. Instead, screensful of Hi-Res color graphics vividly depict all the different unearthly battlegrounds, the warriors and their movements.

Aside from all the adventures already prepared by our designer, you can create your very own — ones that are as long and intricate as you like. You can even store all of them on disk for future play.

But before you can start on any of these Galactic Adventures, you’ve got to take a little down-to-earth trip first. And that’s a quick jaunt to your local game or computer store today!

GALACTIC ADVENTURES™ ($59.95) is available on 48K mini floppy disk for the Apple II Plus or Apple II with Applesoft ROM card.

GALACTIC GLADIATORS™ ($39.95) comes on 48K disk for both the Apple and the Atari® 400/800.

Apple is a registered trademark of Apple Computer, Inc.

For a free color catalog of all our games, write to Strategic Simulations Inc., 465 Fairchild Drive, Suite 108, Mountain View, CA 94043. To order by mail, send your check to: Strategic Simulations Inc., 465 Fairchild Drive, Suite 108, Mountain View, CA 94043. California residents, add 614% sales tax.

Dear Editor:

I am an avid gamer and have been for all but a few early years of my life. I advanced through the various levels of the gaming world much like any other gamer my age, and I faced the same dreaded problems that with the lack of opponents and the mounds of paperwork involved with role-playing. Therefore it was only natural that I realize the potential of the computer in this area. However all the computer related magazines began to drift more into the technical aspects of computing and a well written detailed review of gaming software became harder to find. Then came COMPUTER GAMING WORLD. Long had I wished for just such a magazine and I pounced on a subscription faster than a starving dog on a ham hock. I have read and re-read every issue thus far and I look forward to each new issue impatiently. However, of late I have begun to fear that you too will be drifting to a more technical aspect rather than staying with your namesake. There have been several hints in various articles that you may indeed include articles of a technical nature and although it may be selfish, I hope you will refrain from doing so. There are multitudinous articles on that end of computing in other magazines and as a result I do not subscribe to them but I buy them one issue at a time depending upon interest. You are the official voice of the computer gamer and as such are filling a void inherent in us all. Please try to keep it that way lest we drown in a sea of technicalities.

Another bothersome area for me is the sniveling rivalry between computer enthusiasts. There is the APPLE group, the ATARI group, the TRS-80 group, the PET group, and lord knows what others. Many times I have felt that I am personally being chastised because I happen to own an APPLE II PLUS. I have nothing against ATARI, TRS-80, or PET owners. Why do they insist upon making snide remarks about the APPLE II PLUS? For example there are three such remarks of childish rivalry in the

READER COMMENTS, page 43 of your VOL. 2 No. 5 issue. I quote, "There is a senseless preference shown for APPLES and ATARIS over the TRS-80 graphic junkies."; "Too many games are first developed for the APPLE then converted to the ATARI. ATARI users must then suffer with sub-par graphics and sound"; and "Go monthly and put in some ATARI articles. This past issue had more for the ATARI than other. But APPLE users have enough magazines of their own without giving them 3/4ths of this one also." un-quote.

Competing for top honors in the 'My computer is better than yours" contest does nothing to further the hobby of computer gaming, but a little understanding and co-operation could make quite a difference. I agree that when it comes to software and software reviews practically every computer system except for the APPLE suffers. The question is, who do you blame for this problem? The editors cannot justifyably be blamed as they rely heavily on outside contributions, so who on the outside can be blamed? Is it reasonable to lay the blame on the ATARI users because there is an insufficient amount of good software and/or software reviews for the TRS-80? Of course not. The only people who can be blamed are the users themselves. Someone has to write the software and the reviews, therefore if the PET users feel left out then they must accept the responsibility of doing something to correct the situation. The same would hold true for any computer system and the users of that system.

I would like to see the computer enthusiasts of today come together in friendship and co-operation to make the hobby as exciting and rewarding as it can be. While there is nothing wrong with loyalty to a particular computer system, detrimental comments about other computer systems can easily be avoided and should be, for they serve no useful purpose.

Stephen Stahl
Brazoria, TX

Dear Editor:

Thank you for promoting Robotwar activities. It is a game that requires continuing competition with other players to be fully appreciated.

I was very frustrated when I found out I'd missed your first tournament. I couldn't rest until I'd organized a local tournament, which we've been holding every 2 months ever since. Richard Fowell, creator of "Norden", is one of our club members. We are currently holding our tournaments at Rainbow Computing Inc. 9719 Reseda Blvd., Northridge, California.

Concluding there must be others in this great country that might be searching for Robotwar competition. I also organized a "postal" Robotwar tournament. It is held the 1st of every month with a $4 entry fee to cover prizes and postage. Anyone interested may receive rules and mailing instructions from:

Frank Krogh
P.O. Box 5337
North Hollywood, CA 91616

We've had 3 postal tournaments as of December 1st, 1982. The winners were: "Stalker" by Pat Bachelder from Andrews, TEX; "Norden" by Richard Fowell from Palos Verdes Estates, CAL; "Samoth" by Tom Schai from Roseville, MINN.

Good luck on your 2nd Annual Robotwar tournament.

Frank Krogh
INSIDE THE INDUSTRY
by Dana Lombardy,
Associate Publisher Game Merchandising

Last issue we listed almost 400 different new game software titles that were released in 1982. Looking at the data provided by the survey forms returned from the computer game publishers, we find some interesting facts.

Out of over 150 computer game software publishers, 81 listed their 1982 game releases, 6 were still active but had no new game releases, one was out of business, and one was no longer publishing game software. 69 were sent forms but never replied, despite two separate requests. Of the 81 responding, a total of 394 games were produced in 1982 (about 5 games per company). If we assume that at least 60 of the non-responding companies also had game releases last year, that would bring the total number of computer game software games published in 1982 to 694!

A list of the 30 most prolific game software publishers follows. Even when including the games from non-reporting companies, these 30 software publishers (20% of the game manufacturers) account for nearly half of all game releases in 1982. In fact, just counting the top ten on the list shows that these firms (7% of the industry) account for one-quarter of all 1982 game software releases.

It must be noted that this list does not rank the companies by their size or the number of any one particular game sold. Some of the publishers with only a few game releases in 1982 had tremendously successful titles. This list is just one of several methods of measuring America's most rapidly-growing hobby: computer gaming.

(The remaining 51 companies that reported publishing games in 1982 had four or fewer titles released.)

HOBBY AND INDUSTRY NEWS

Broderbund Software, Inc. has entered the CARTRIDGE game market with its first two Atari cartridge releases: CHOPPER and SERPENTINE. Both games are 16K.

Broderbund also announced its entry into the VIC-20 market with three cassette programs MARTIAN RAIDER, SHARK TRAP, and MULTISOUND SYNTHESIZER. All three programs are compatible with the expanded VIC-20 and have suggested retail prices of $19.95.

The Games Network, a computer-games-by-cable company, has released the results of its two month charter membership drive (November 1, 1982 - January 1, 1983). According to Thom Keith, Executive Vice President of Network Affairs, "a total of 190 systems signed charter membership reservations. 106 systems signed charter agreements and an additional 11 systems became affiliates." During the first two weeks of January, 103 more systems signed on. Bringing the total to 470 systems, representing a potential of over five million subscribers. The Games Network will go "on line" in September.

SubLOGIC has announced the release of their game, "NIGHT MISSION" PINBALL for the IBM PC. The game will run on any IBM PC with 64K and an IBM Color/Graphics Monitor Adapter. It will be available on disk and sell for $39.95.

McKelvie Programs, P.O. Box 53076, Phila., PA 19105, has released GAMEMASTER, a new program for the Timex-Sinclair and ZX-81 computers. Gamemaster is a control and record keeping system for role-playing fantasy adventure games. It is compatible with TSR's Dungeons and Dragons role-playing game.

Michael C. Katz, former vice president of marketing and corporate communications at Coleco Industries, has been named president and chief executive officer of EPYX, Sunnyvale, CA.

Automated Simulations/EPYX has updated its computer football game, TUESDAY MORNING QUARTERBACK, to reflect the 1982 football season. The game is available on disk for the TRS-80 (48K) and the Apple II (48K). It sells for $29.95.

Automated Simulations/EPYX have also expanded their line of products for the VIC-20. The new additions are SWORD OF FARGOAL; RESCUE AT RIGEL; CRUSH; CRUMBLE AND CHOMP; MONSTER MAZE; and RICOCHET. The first three are 16K cassettes with a suggested retail price of $29.95. Monster Maze is available on cartridge and retails for $39.95, while Ricochet is 8K on cassette for $19.95.

Sir-tech has announced the release of the third WIZARDRY scenario. LEGACY OF LLYGAMYN. Also out for Wizardry is WIZPRINT, a printout utility designed to print such information as a character's gold, experience, attributes, spells, and other items that Wizardry players need printed.

Two more new releases from Sir-tech are PITS OF PERIL, an arcade game for the Apple II (48K), and POLICE ARTIST, a children's game which is basically a face recognition program for ages 7 to 14.

Penguin Software has announced that, as of March 1, 1983, they will be lowering the price of their games to $19.95. This will include both their old titles and their new ones (Thunderbolts and Crime Wave).

Software Centre International now has 22 franchises opened or under construction nationally. Over 100 locations may be secured by June, according to their president, Glen Johnson.

Infocom, Inc. and Osborne Computer Corp. have announced an agreement that paves the way for Osborne to distribute the full line of Infocom's entertainment software.

Avalon Hill has added three new titles to their list of games for the IBM PC: COMPUTER FOOTBALL STRATEGY, V.C. and 8-1 NUCLEAR BOMBER all require 48K and sell for $21.00, $25.00, and $21.00 respectively.

Continued on p.40
REAL WORLD GAMING

PROGRAMMING

For those who may have joined this series late, here is a brief recap of the previous installments.

A simulation game is a game that mimics a real world field of interest. It can allow players to experience some of the excitement of being anything from a stunt pilot to a millionaire businessman. In the last three issues we have covered the System Definition, Data Collection and Model Development phases in constructing a simulation game.

System Definition is the first step. It is similar to making an outline of your subject for a speech or an article. You define a "system boundary" that tells what things are "inside elements" and what things are "outside influences". At this point you also list the relationships between the elements of the system.

Next comes Data Collection where you observe and investigate the system you have chosen as the basis for a game. You try to answer the questions "How often do things happen?", "What quantity of things occur?" and "How do things affect other things?"

In Model Development you take all the pieces of information that you collected about your system and "boil them down" to probabilities, averages and ranges. All outcomes and relationships have to end up as some form of numeric data or you can't use them in your game.

Now that everyone is up to date we are ready for the next step — Programming. Although this phase does include actual computer programming, it involves much more than just writing code in your favorite language. You are now faced with the job of designing a GAME! Up until now we have talked about developing a simulation model. This model (if done well) should be a fair representation of what things are like in the real world. But, just as animation by itself does not make a good arcade game, a good simulation game needs more than simply a model.

The previous three sections of this column covered some of the technical aspects of the design of a simulation game. The information presented was mostly objective since systems simulation is based on scientific methods. However, the design of a game is more of an art than a science. There are very few rules and even those are occasionally broken to produce good games. So, the things I present here cannot be footnoted and referred to in a text book. They are "approaches" that others and myself have used to create games.

One approach uses a tool called a story-board. This is a script of the game as it will be experienced by the players. The story-board will help you examine the flow of the game before you spend a lot of time writing the program. Included in the story-board are all of the main features you will use in your game. This information will allow you and others to better imagine what it will be like to play your game. It is easier to revise your design to fix any problems at this point than later when you are chasing program bugs.

One main element the story-board helps you visualize is how the players interact with the model. From the standpoint of the model design, the key question previously was "How does the system function?". Now you have to decide "How will the players affect the system?". The player interaction with the system can be thought of as their decisions. There is some relationship between the number of decisions you allow the players and the realism of the simulation. But it is not a simple relationship. Participants in real life systems typically (though not always) have numerous alternatives open to them. However, it is not necessary to give players all the options the system can support to make a realistic game. For instance in a business game I wrote, Cartels & Cutthroats, only seven decisions were needed by players to manage their hypothetical companies. Obviously, in the real world there are many more factors for a corporate president to analyze. However, for playability it was more important that the decisions made be direct and simple. Even with this small number of inputs it was possible to create a very realistic "feel" through a mixture of randomness and factor influence.

Thus, to complete your game design you need to know how many and what types of decisions players will have to make. You must also plan how they will input the information. Although a keyboard provides the greatest flexibility, serious consideration should be given to game input devices. Paddles and joysticks are a lot less intimidating than a keyboard to almost everyone. In addition, from a programming point of view it is often easier to flag bad inputs from a joystick than to catch a bad key press or misspelled word.

Input is only half of the player interaction of your game. The other part is the output from the system to player. Although it is possible to produce a simulation game where all of the output is in the form of text, my own experience indicates this may not be desirable. In 1979 I wrote a football game, Computer Quarterback that was based on exhaustive research on the outcomes of combinations of offensive and defensive plays. For each running play against each defense I derived five values that were used to generate outcomes. For each passing play there were seven variables used to determine the outcome against each defense. Overall, this model
In addition to games mentioned elsewhere in this issue, the following products have been received by CGW. Some of these products will receive more detailed attention in future issues. Readers wishing to review any of these products should contact CGW.

Adventure International
Box 3435
Longwood, FL 32750

MACES & MAGIC #2—THE STONE OF ISISPHUS: A graphics/text adventure game by Chameleon Software. Several of its unusual features include a well executed coded hint sheet and very large numbers of potential weapons and types of armor. Atari (48K), Apple II, TRS-80.

Avalon Hill Game Co.
4517 Harford Rd.
Baltimore, MD 21214

ALIEN: A computer game based on the theme of the movie of the same name. The alien, which will metamorphose to more deadly forms as time goes on must be detected then captured or destroyed. Apple II. $29.00

Avalon Hill Game Co.
4517 Harford Rd.
Baltimore, MD 21214

GFS SORCERESS: The first in a continuing series of games based on the saga of Joe Justin and Selena Sakarov. A two-word text adventure game. In addition to the disk and rule book you get "Testless Universe" a fictional story that introduces the adventure and the "Galactic Federation Naval Officer's Manual."

CBS Software
Hagerstown, MD 21740

K-RAZY KRITTERS: A Space Invaders type game for the Atari 400/800. 10 levels of play. Cartridge.

Funsoft
28611 Canwood St.
Agoura, CA 91301

TIME RUNNER: Similar to a maze-chase game, TR involves the hand-eye skills of running around a maze and the strategy skills of surrounding parts of the maze to gain points. Wrap your trail around a box and get so many points. Atari 400/800 disk or tape (16K). $29.95

Hexcraft Inc.
P.O. Box 39
Cambridge, MA 02238

GENESIS - THE ADVENTURE CREATOR: Here is a real sleeper. Game generating programs are becoming more and more popular (e.g. The Arcade Machine, Pinball Construction Kit). Genesis is an adventure game generator. In "The Creator" portion of the program you create your map, objects, commands, and text. You can create your own custom adventures. We like it. Apple II (or Atari, IBM PC, Commodore coming). $49.00

Imagic
P.O. Box 2055
Saratoga, CA 95070

DEMONATTACK: Imagic has translated their popular Demon Attack Atari VCS game to the Atari 400/800. The cartridge based game is well done graphically, however the game design itself is nothing new (basic Phoenix type game). Game variations allow two player games, advanced games, and tracer shots that can be controlled after firing. Atari 400/800

Howard W. Sams & Co.
4300 W. 62nd St.
Indianapolis, IN 46268

CAVES OF OLYMPUS: A hi-res adventure game using two-word command format.

Imagic
P.O. Box 2055
Saratoga, CA 95070

MUSIC GAMES: Using the reinforcement technique of learning, Music Games teaching the elements of music. Categories of games/lessons are: Ear Training, Listening, Note Recognition, and Rhythm. The hi-res program even includes Bach’s “Solfeggietto” at a tempo of your choosing. Apple II.

Imagic
P.O. Box 2055
Saratoga, CA 95070

WHAT'S SO FUNNY ABOUT COMPUTERS: A book of cartoons by S. Harris. The Cartoons cover such subjects as artificial intelligence, invasion of privacy, and home computer applications. $6.95 in paperback.

THE PROGRAMMABLE CUBE: A simulator and game based on the popular Rubik's Cube. The simulator shows all six sides and simulates motion for each move. A complete solver guides the user step by step through the solution of any scrambled cube. The program uses a simple-to-learn special programming language. Apple II.

HIDE AND SINK: You play against the computer in this sea war game. There are three versions of play: Standard H&S, Super H&S, and Super-Salvo H&S. The standard version is basically a souped-up computerized version of the pencil and paper game "Battleship". Your ships are hidden on a 10x10 grid and the enemy takes shots trying to hit your hidden ships while in your turn you try to hit his hidden ships. "Super" and "Super-Salvo" add missiles and increased firepower. A nighttime option makes sighting more challenging. Apple and IBM PC. $34.95

HEXTACY: A symbolic territorial war game with some similarities to the Oriental game GO. However, unlike GO, "stones" need not be exclusively surrounded by one's opponent's stones. A stone surrounded by more than one player's stones is captured by the player with the most stones surrounding said stone. The significant thing about Hextacy is that it can be played by up to three players plus the computer as the four player. Apple and IBM PC. $34.95

MUSE SOFTWARE
347 N. Charles St.
Baltimore, MD 21201

THE CAVERNS OF FREITAG: This is going to be a popular game. According to some of the people at Muse TCOF is better than their popular Castle Wolfenstein. We agree. TCOF is an underground fantasy adventure in which you work your way through a large maze to seek out and destroy the evil dragon Freitag. You can select from three different display modes. The three modes allow you to get a variety of overhead views: from close/detailed to far/plain. Other features include spells, increasing rank, selectable speed and level of play. Apple II.

NEXA CORP.
P.O. Box 26468
San Francisco, CA 94126-6468

CAPTAIN COSMO: An arcade game that has similarities to Defender but has the appearance of a children's game. Both the fiction and graphics of the game seem to be geared to youngsters. You as the good Captain must turn the grumpy Munchies into happy Smilies with your Somanizer ray. Spacey Stacey and Devious Dan attempt to thwart you. However the appearance of the game notwithstanding, at advanced levels CC is just as challenging as any arcade style game. Apple II. $35.00
PIE-MAN: A “different” kind of arcade game. You are working in an automated bakery (we don’t know why your job hasn’t been automated). You must take the pies as they come out of the conveyor, put whipped cream and a cherry on them then take the finished pie to the pie bin. Sacks of flour, greasy floors, and tipsy wedding cake bakers make your job more difficult. Apple II. $19.95. Note: the penguin runs away from the haunted mansion, eyes covered in fear.

Rena-Soft
1070 Shary Circle
Concord, CA 94518

ARTESIAN: A four-level arcade game in which you attempt to steal water-filled jugs from the fourth floor (“It’s the water” you know.) The first level is a Pac-Man like maze. Level two involves crossing conveyor belts and walkways (Frogger). Level three involves negotiating moving gears and barrels (Donkey Kong). The fourth level is where you fill your jars. Apple II. $34.95

Strategic Simulations
883 Sheriff Rd. Bld. A-200
Mountain View, CA 94043-1983

GALACTIC ADVENTURES: A science fiction adventure game with spaceship and man-to-man combat. Based on the Galactic Gladiators game, GA expands the scope of GG while providing the ability to design adventure campaigns for others to play. Apple II. $39.95

Sierra On-Line
3675 Mudge Ranch Rd.
Coarsegold, CA 93614

CROSSFIRE: the IBM PC version of the popular arcade/strategy game. You must destroy aliens before they destroy you as you make your way around the city streets. $29.95

ULYSSES: The IBM PC version of Hi-Res Adventure #4. You are Ulysses in this two-word adventure game. You must retrieve the Golden Fleece. Two disks. Documentation is beautiful. $39.95

Soft Images
200 Route 17
Mahwah, NJ 07430

BLACK JACK STRATEGY: A totally new Black Jack program by Norman Wazaney Jr. This one is much more user oriented than BLACKJACK MASTER (TRS-80, see review in 2.2). The program includes the game, black jack tutor, and a simulator in which you can try out your strategies. The system provides step-by-step instructions to help raise the player’s level of skill—without relying on card counting. Apple II. $69.95

PANDEMONIUM: A word game for the Apple and TRS-80. The object of the game is to place twenty-five randomly generated let-
ters onto a five-by-five playing board matrix in order to construct three, four, and five letter words. There are several game variations available. Any number from one to a full party can play. $39.95

**SINGLES’ NIGHT AT MOLLY’S:** Two solitaire card games make up SNAM. Royal Flush uses a 5x5 matrix and 25 randomly drawn cards. The object is to place the cards onto the matrix in such a way as to achieve the highest possible score. Sly Fox is a computer version of the 2 deck solitaire game which requires more skill than luck to win. Apple II. $29.95

Sirius Software
10364 Rockingham Dr.
Sacramento, CA 95827

**FLIP OUT:** A nice little strategy game in which a hi-res screen of gates open and close to trap or release marbles which must be made to fall to the bottom of the playing field. A mental challenge. There are nine different playing "fields." Apple II. Atari.

**WAVY NAVY:** A Space Invaders type game in which your ship rides giant waves while trying to shoot down enemy aircraft. The wavy effect adds the challenge of varying the distance to the enemy aircraft. Underwater mines must also be avoided. Apple II. Atari.

SubLOGIC Corp.
713 Edgewater Dr.
Champaign, IL 61820

**NIGHT MISSION PINBALL:** The Atari version of NMPB is now out. An 18pg. Adjustment Manual comes with the game to customize it to your liking. See micro-review in 3.1. $34.95

T3R Hobbies, Inc.
P.O. Box 756
Lake Geneva, WI 53147

**DUNGEON:** A computerized version of their popular board game of the same name. As a solo adventure forget it. As a multi-player game (up to eight can play) in which each player is vying for the same treasures, Dungeon is worthwhile. Good graphics and packaging. Apple II.

**THESEUS AND THE MINOTAUR:** A 3-D full color maze game in which you must rescue the princess Ariadne. Not nearly as detailed as Wizardry but somewhat better for graphics. The creatures appear in the maze itself, rather than in a separate window. Apple II.

Xerox Education Publications
Computer Software Div.
Middletown, CT 06457

**OLD IRONSIDES:** For some time now we have wanted to see a good “Fighting Sail” era naval game incorporating many of the elements of “Wooden Ships and Iron Men”, Avalon Hill’s award winning board game on fighting sail. Although Old Ironsides is not as detailed as the AH board game, it does an excellent job of recreating the “feel” of naval combat under sail power. The two ships each have six guns per side and six rounds of power. Guns can be eliminated. Powder is used up. Powder is replaced at a rate slower than you fire rate therefore you must keep an eye on your ammo. You can sail off in the fog and fire from it’s safety. All-in-all a very good game of which we hope to share more in our next issue. Apple II. $39.95

**STICKYBEAR BOP:** An animated shooting gallery of Stickybears, ducks, planets, balloons, etc. Each round requires more skill. Free posters and stickers. For ages 3 and up. Apple II. $39.95

Mind Games, Inc.
420 So. Beverly Dr., Suite 207
Beverly Hills, CA 90212

**THE DESECRATION:** A hi-res/text adventure game with a difference. Embedded in the game are three arcade game sequences. At certain points in the adventure you will be faced with an arcade game challenge. If you fail to survive the arcade sequence, you die and must start over. TD is the first in a planned series of games. Apple II. $37.95
SOME READER COMMENTS

Here are some answers you readers sent to us in response to recent questions on the READER INPUT DEVICES.

WHAT WAS THE PRIME REASON YOU PURCHASED A PERSONAL COMPUTER?

The breakdown on this question from RID #5 was:

- Entertainment: 74%
- Business: 17%
- Education: 9%
- Programming: 5%
- Word Processing: 3%

Several readers indicated two reasons why they bought a computer hence the responses totaled more than 100% by category. Those that picked two categories picked entertainment along with one of the other four.

WHAT WAS THE SINGLE MOST IMPORTANT GAME RELEASE AND/OR OCCURRENCE IN THE COMPUTER GAMING HOBBY AND INDUSTRY IN 1982?

This question, also from RID #5, brought a wide range of responses. Most of the respondents selected a game release as the most important game/event of the year. Topping the list of MOST IMPORTANT GAME RELEASES OF 1982 were: Guadalcanal Campaign (25 votes); Choplifter! (12 votes); Wizardry (11 votes); Eastern Front (7 votes). Others that received votes as the "most important game release in 1982" were: Legionnaire; Galactic Gladiators; Southern Command; Pursuit of the Graf Spee; Napoleon's Campaigns 1813-1815; David's Midnight Magic; Time Zone; Ultima II, The Mark of the Sun; Cytron Masters; Aztec. Among those selecting a "Most important occurrence in computer gaming in 1982" there was a wide range of opinions. Here are some of those opinions:

THE MOST IMPORTANT OCCURRENCE IN COMPUTER GAMING IN 1982 WAS:

- The capture of the gaming market once dominated by Apple and TRS-80 by the Atari.
- SSI's acknowledgement of Atari gamers and their expansion of their Atari line.
- Announcement of the improved Apple II coming out early in 1983.
- That the news media awoke to the booming growth of the microcomputer and told the general public.
- Introduction of strategy/action games which combine strategy and arcade action.

DO YOU PREFER BUYING GAME PROGRAMS FROM DISCOUNT MAIL ORDER HOUSES OR FROM LOCAL RETAILERS? WHY?

This question which was asked in RID #4 gained a lot of response. Everyone had an opinion on this one. Of those responding the breakdown was:

- Local Retailer: 58%
- Mail Order House: 38%
- Both: 4%

The most common reason given for buying from the local retailer was the opportunity to preview the game, the most common reason given for buying from a mail order house was lower prices. The question of customer support was a toss-up. Some felt they got better support from the local dealer since he could often replace a product on the spot. Others thought that they got better support from the mail order house which knew more about the games and had a better selection from which to choose. Some said that they would like to buy from local retailers but because of location (Alaska, Spain, etc.) were forced to shop through the mail.

2.1 — Napoleon's Campaigns 1813 & 1815; The Swordthrust Series; Galaxy; Castle Wolfenstein; Tanktics; Baseball Tournament (Pt. 2); Operation Apocalypse; and more.

2.2 — Southern Command; So You Want to Write a Computer Game; Napoleon's Campaigns Designer's Notes; Blackjack Master; The Current State of Computer Documentation; Robotwar Tournament Winner; Tigers in the Snow; Bug Attack; David's Midnight Magic; and more.

2.3 — Wizardry; Tactics in Eastern Front; Time Zone Interview; Voyager I; West Coast Computer Faire Photos; Long Distance Gaming; Jabbertalk; Baseball Tournament Results; Olympic Decathlon; Lunar Lander (TRS-80); Swashbuckler; Silicon Cerebrum; Atari Arcade; Writing For CGW; and more.

2.4 — Warp Factor; Rendezvous; Economic Simulations for the Apple: Controller; Graf Spee; Starship Commander; Captain 80 Adventure Book; Horse Racing Classic; Knight of Diamonds; Dnieper River Line; Choplifter!; Casino; and more.

2.5 — Labyrinthine; Software Piracy; Starblazer; Galactic Gladiators Review and Scenario; Atari — Exploring the Human Connection; Guadalcanal Campaign; Robot Tournament; The Road to Gettysburg; Cytron Masters; Starship Commander Notes; Invasion Orion; and more.

2.6 — History of a Wargame Design; Japanese Strategy in Guadalcanal Campaign; Four For The Atari; Eastern Front Scenarios; Star Maze; Legionnaire; Cytron Masters Upgrade; Apple to Atari; Andromeda Conquest; Torpedo Fire Scenarios; Beyond Sargon II; and more.

3.1 — Test Pilot; Serpentine; Cosmic Balance; S.E.U.I.S.; Armor Assault; The Arcade Machine; The Atari Arena; The Learning Game; INDEX, and more.
The Winter Consumer Electronics Show held recently in Las Vegas gave us a glimpse of what will be the trends in computers in 1983 and beyond. CES, which showcases consumer electronic products, covers much more than computers, but this particular edition of CES illuminated the fact that personal and home computers are the wave of the future in the electronics field.

**THE CHANGING MARKETPLACE**

Perhaps the most significant fact that CES revealed was that the line of demarcation between personal computers and home video systems has disappeared.

Until very recently it had been safe to say that there were two types of machines which play computer games in the home. One of these being the home video machine (costing less than $300 and cartridge-based), represented by machines like the Atari VCS, Mattel Intellivision, Magnavox Odyssey, and ColecoVision. The other type machine one could play computer games on was the personal computer such as the Apple, Atari 400/800, IBM-PC, TRS-80 etc.

However with the introduction of the Vic-20 in 1982, the cost of computers coming down, and the functional power of the game machines increasing, we can no longer look at the field as two distinct entities. Manufacturers are now looking at the home electronic market more as a continuum which they can reach with three types of machines, the home video machine, the HOME computer, and the PERSONAL computer.

The home computer is seen as a machine which is a microcomputer much like the personal computer but is marketed for the family and designed to meet applications in the home rather than in business. For example, the Atari 400/800 is now seen as a home computer and the Apple computer is seen as a personal computer. The former costs less, emphasizes entertainment and other home related functions such as educational programs. Choosing this type of target and combining it with mass merchandising techniques has resulted in Atari by passing Apple. Game manufacturers, realizing this, have begun to change emphasis from the Apple to the Atari. While the Apple has been used by many as an entertainment device, its’ main function is perceived to be as a business or professional machine. The IBM pc also falls into the personal computer category.

According to David Blumstein, Executive V.P. of Softsel, a major software distribution company, the Apple is now on the decline as an entertainment machine in terms of market share. The manufacturers are looking instead to the mass market of the home computers such as the Atari 400/800, Commodore Vic-20, and TI 99/4A. Blumstein goes on to say that “the (game software) industry is following the marketplace and the marketplace is in the small home computers”.

Another aspect of the changing computer game marketplace is the status of the individual game designer. One speculates about possible raiding of personal computer game companies by the big mass merchandising cartridge game manufacturers to find top game designing talent. At this point it has not been a problem, but what about the future. Doug Carlson of Broderbund Software feels that personal computer software houses such as Broderbund will always be able to be attractive to game des-
igners not only because they pay well but also because designers working in or with personal computer software houses are an active part of the creative process, not just a cog in a corporate wheel. Carlson sees this creative relationship between the companies and the designers as a key reason that companies like Broderbund will be able to compete effectively with the mass market giants.

No one has to be told that the market for computers and computer games grew enormously in 1982. In terms of computer games, entertainment software makes up 45% of the volume for home computer software and, according to Future Computing of Richardson, Texas (a consulting group on computer marketing), that market share should grow to 55% by 1987. The only other area that is expected to grow is educational software which now makes up 12% of the software but should command a 21% share by 1987 (see chart).

With the growth of the personal/home computer marketplace comes the growth in Number of products available. In recent days both Atari (Atari 1200) and Apple (IIe) have released new machines. While these two machines are more business oriented and fall into the personal computer category, never-the-less they will bring more customers into the computer game marketplace.

Mattel has announced the release of the Aquarius Home Computer System. Retail price for the basic unit will be under $200. Some of the more popular Mattel Intellivision games will be available for the Aquarius Home Computer.

Mattral also plans to release a computer keyboard upgrade to their Intellivision game system and call the new system the Entertainment Computer System. It will, according to Gary Maskovitz, Mattel Marketing director, be “right between video games that compute and computers that play video games”.

The Sinclair and TI 99/2 computers are two low-cost entries that bear watching in the months ahead.

If CES revealed nothing else, it revealed that computerized entertainment will be a major force in the 1980's. There is in that marketplace a need for the game retailer who can offer computer game products and give the consumer expert advice in choosing where to spend his entertainment dollars.

**HIA REPORT**

Another show of importance to computer gamers took place in January. The Hobby Industry Association (HIA) held its annual convention and trade show in Anaheim during the last week of the month. One of the divisions of HIA is Adventure Gaming. The member companies of this division are major manufacturers of strategy board games as well as role-playing games. These companies produce most of the "Dungeons and Dragons" type games as well as nearly all the strategic and/or wargames that can be found in any game store.

Avalon Hill has been one of the few companies in HIA which have also been producing computer games. Although not a member of HIA, SSI is another computer game manufacturer whose games are similar in subject matter to the type games produced by these board game and role playing game companies.

While it is true that computer games have not been a major product of these companies, this year's HIA/Adventure game members made it known that they are working on computer games. In 1983-1984 we will see many of these companies enter the computer game field with releases of personal computer games.

With the growth in Number of products available, in recent days both Atari (Atari 1200) and Apple (IIe) have released new computers. While these two machines are more business oriented and fall into the personal computer category, never-the-less they will bring more customers into the computer game marketplace.

Mattel has announced the release of the Aquarius Home Computer System. Retail price for the basic unit will be under $200. Some of the more popular Mattel Intellivision games will be available for the Aquarius Home Computer.

Mattral also plans to release a computer keyboard upgrade to their Intellivision game system and call the new system the Entertainment Computer System. It will, according to Gary Maskovitz, Mattel Marketing director, be “right between video games that compute and computers that play video games”.

The Sinclair and TI 99/2 computers are two low-cost entries that bear watching in the months ahead.

If CES revealed nothing else, it revealed that computerized entertainment will be a major force in the 1980's. There is in that marketplace a need for the game retailer who can offer computer game products and give the consumer expert advice in choosing where to spend his entertainment dollars.

THOUSANDS OF INNOVATIVE APPLE-COMPATIBLE PRODUCTS ARE GATHERING AT appleFest 1983

Anaheim Boston San Francisco
DON'T MISS APPLEFEST FOR 1983
THE WORLD'S LARGEST EXPOSITION
EXCLUSIVELY FOR APPLE OWNERS

Each show features hundreds of exhibits of the newest, state-of-the-art products for the Apple. You can see and try out software for every conceivable application—from arcade games to investment programs, music to machine language, teaching systems to accounting packages, word processors to graphics processors. You can sample hundreds of different peripherals, including printers, hard disks, modems, memory cards, video displays and synthesizers, plus accessories, publications and invaluable support services.

Applefest is the place to view the most technologically advanced products for the Apple.

At Applefest you can try out and compare hundreds of products in an exciting, information-filled environment. You can learn more in two days than you could in months of visiting computer stores and reading trade journals.

And, best of all, everything on display at Applefest is for sale at special show prices, so you can save hundreds—even thousands—of dollars by making your purchases at the show.

This year a whole new conference program is being introduced to Applefests nationwide. The program will show you how to squeeze absolutely the most power, versatility and usefulness out of your Apple.

Seminars and workshops will teach you the ins and outs of buying software intelligently, using spreadsheet and database programs, putting Apples to work in classrooms and using the Apple as a management tool. You’ll learn about new programming languages, important applications for telecommunications, exciting ways to use graphics and more.

No matter what you do (or want to do) with your Apple, the Applefest seminars and workshops will help you do it better.

Software Spotlight will provide an in-depth, understandable look at hundreds of different software packages. Each Spotlight will cover the features, capabilities and limitations of a group of packages, to help you find the software that’s best suited to your applications. Experts will be on hand to answer all your questions.

So plan on attending Applefest for 1983—the biggest and best Apple-user show ever. It’ll be a mind-expanding experience for both you and your Apple.

Daily Registration Fees
Exhibits-only badges are $8 per day, and the Conference Program is $15 per day.

Special Pre-Registration Discount
If you plan to attend Applefest now with advance registration. Three-day Exhibits and Conference badges are $48, you save $21. Three-day Exhibits only badges at $16, you save $6.

Additional Information
To receive more information about attending or exhibiting at Applefest, including the Conference, Seminar, Workshop and Panel Discussions Program, or information on local hotels call 617-739-2000 or 800-841-7000 (Boston).
COSMIC BALANCE: Tactics and Ship Design

On the first turn, if you discover that your mass is greater than the enemy fleet's, then you should press him closely and try to destroy as many ships as possible in the first ten turns before he warps out.

If both fleets have about equal mass, then you should approach cautiously in an oblique or spiral course. If the enemy fleet begins inflicting more damage than you, he may have higher technology ships or better designed ships, and you should try to disengage immediately.

If you have any ships that have mainly long range weapons, such as Ship A (see listing); they should obviously stand away from the enemy ships. However, if the range exceeds 100, the computer's ships may automatically try to warp out in solitaire play after ten turns.

If you have more than one ship with short range weapons, you should keep them in a close formation and try to gang up on a single enemy ship, preferably his smallest ship first. Once you select your target, it is probably best to stay close and continue firing at it, as your fire will become increasingly destructive as you wear down his shields. Additionally, you will probably get more victory points for destroying one ship than for partially damaging two and, in the new strategic game, there will be automatic free repairs for all damaged ships which escape.

Carefully observe which shields the enemy is firing through, what types of weapons he fires, and whether his fire is more effective than yours at different ranges. If it appears that he has few weapons in certain areas, try to maneuver one or more ships in close on that arc. If your weapons are more effective at a certain range than his, then try to keep that minimum distance between your ships. If he is using weapons for which you have special defenses, such as belts, then be sure to keep your belts fully charged. All of this is easier said than done, as you don't know where he will move next, but you should try. You may be able to detect patterns in how he maneuvers which will enable you to predict his next move.

In general, you should not move in straight lines too often; making it easier for the opponent to predict your next move. It is better to approach your target in a curving or spiral maneuver in order to keep him guessing, and also to hopefully trigger premature fire by him at long range if he has set his weapons to fire at the "last instant" command.

You should try to plot courses which will bring you in close to the target and then back out to a safer distance all in the same turn. As you make your pass by the target, your short range weapons should be set on the "time point" command to blast him at the estimated shortest range, but do try to leave some margin for error in the angle of your approach, or your weapons may not be able to bear on the target. If you are successful in timing your fire at the shortest feasible range, and if his weapons shoot at longer range, you should be able to inflict substantially greater damage than you receive. Try to avoid ending the turn in a position close to his ship, as this might give him a free "cheap shot" at the start of the next turn.

You should use the "time point" command to set your weapons to fire in several bursts on consecutive time points in order to inflict maximum damage, not all on the same time point. Each burst should be calculated to inflict about 40 damage factors in order to overwhelm any shield. After the shield is penetrated, if any damage factor strikes a layer of armor, all additional damage in that time point will be deflected. Therefore two bursts of 40 damage factors each in two consecutive time points will probably be more destructive than one burst of 80 in one time point. Armor will deflect much of the damage from each burst, therefore it is better to have several smaller bursts than...
one large burst. As you begin to wear down his shields, you should try to reduce the size of each burst to 30 or less on a greater number of time points. Less damage will be needed to overwhelm his shields.

The plasma torpedo is the only weapon which can destroy armor sectors, but it must be used at point blank range to be effective. If it is fired at long range, it will not inflict as many damage factors, or the target may simply turn away from it and outrun it. Ideally, you should try to time this weapon to fire at a range of five or less as the target is moving toward you, so that he will have less time to take evasive action. You should also try to launch one light seeker on the same turn as you fire the plasma torpedo so that the seeker will hopefully reduce his belt strength before the plasma impacts the target.

If you are giving more damage than you are receiving, then press him closely so that he will not have time to recharge his shields or escape. However, if he succeeds in breaching one of your shields, you should try to withdraw temporarily to repair the shield before making another close pass. Try to keep the breached shield facing away from him until it is recharged.

If an enemy ship takes a straight line course away from you, this probably means either you have critically injured him and he is trying to escape, or you have destroyed enough of his sub warp drives so that he can no longer maneuver at sub warp speed and is coasting away from you. Either way, you should immediately pursue and try to finish him off. If you observe that he has no weapons covering one of his four rearward facing arcs, then try to overtake him with a converging course approaching through that arc. It may be unchivalrous, but it is better to pound a cripple through a defenseless arc than to trade punches through his strong arcs.

Your priorities for allocating your ship's power to its various systems will change as the tactical situation changes, but the following generalities should be useful in most situations. Electronic countermeasures are a good investment of power, and you should always use them. Electronic counter-counter measures are also very effective. Speed and course changes should be your second priority for allocation of energy except at point blank ranges. At short ranges you should give priority to charging and firing weapons over recharging shields, but reverse this order of priority at long ranges. Draining shield batteries in order to obtain additional power to boost other equipment is not a good idea, unless this is your only way to charge all of your weapons at short range.

The program's subroutine for solitaire play against the computer is very effective, and you can improve your own play by understanding how the computer "thinks". On each turn the computer first identifies which arc of each of its ships has the strongest combined value for both shields and weapons, and then plots a course which will hopefully turn that arc toward the closest player ship. Hence, if arc one or eight is the strongest, the computer's ship will fly directly toward the target. If arc four or five is the strongest, the computer's ship will fly directly away from the target. If arc two is the strongest, the computer's ship will spiral toward the target in a clockwise turn. If arc seven is the strongest, the computer's ship will spiral toward the target in a counterclockwise turn. If arc three or arc six is the strongest, the computer's ship will spiral away from the target in a clockwise or counterclockwise turn. If all arcs have equal strength, the computer arbitrarily selects arc eight as the strongest, and tries to turn that arc toward the target. If the range between the computer's ships and the player's ships exceeds 100, the computer's ships may try to warp out after ten turns. Be warned, the computer is very effective at predicting the target's course and timing fire at the closest range.

The computer's priorities for allocating power to its systems are as follows: First, it charges multiple turn charge weapons such as disruptors and plasmas. Second, it charges electronic counter-counter measures, and third it charges belts. Fourth, it makes speed and course changes, and charges single turn charge weapons such as phasers. Fifth, it charges electronic counter measures. Lastly, it charges transporters for boarding parties and recharges shields.

The main idea about ship design is that there is no single perfect design. If you know the capabilities of the opposing ship or ships, you can probably create a special design which will be superior to that particular opponent. Therefore, you should always design your ships secretly and arrange to play against unknown ships in order to get the most challenging competition.

The starship designs provided with this article are only introductory, and each could be improved with modifications. Each ship is a large dreadnought designed for command by the computer in solitaire play against a human player, but you could of course use or modify these ships for use by a player.

The major consideration in designing ships is the intended use of the ships. For the new strategic game, it will be important to develop new designs for large unarmored transports, fast commerce raiders, small unarmed scout ships, and cheap slow convoy escorts. But for the CGW starship design tournament, you should probably concentrate on single dreadnoughts for ship to ship combat. Under the tournament's 250 victory point ceiling for entries, a single dreadnought should have several advantages over an entry composed of several smaller ships. First, the single dreadnought will have more space for weapons and equipment than any entry composed of several smaller ships. Second, ships in multiple ship entry would have to duplicate the single dreadnought's costs for warp drive, armor, shields, sub warp drives, engines and belts. Third, the dreadnought's size should give it greater survivability than any smaller ship. Therefore even if all the judges do well against a dreadnought entry, the dreadnought will at least have a better chance of escaping with a respectable score by warping out to safety after the tenth turn.

Ship A is a fighter carrier which should be effective against any single ship with a small number of belts. It has no armor and high speed, just like a naval aircraft carrier and has strong rear arcs so that it will spiral away from the opponent. Lacking armor and short range weapons, it depends on speed and distance to escape injury. This design may not be able to destroy another dreadnought before it warps out, but it has a good chance of running up a small positive victory point differential, which could be decisive under the CGW starship design tournament rules.

Ship B is designed to transport boarding parties for capture of enemy ships. This type of ship could be a big winner in the CGW design tournament because you get extra...
victory points for capture of enemy ships. This design requires lots of engines and excess power because transportation of boarding parties is a very low priority in the program’s solitaire play subroutine. The target’s shields must be penetrated before marines can be beamed aboard. Although this ship is very slow and clumsy, it doesn’t need much maneuverability because transporters have unlimited range and are omni-directional. The forward arcs have been made much stronger than the other arcs so that the computer will turn the ship toward the target in order to hopefully close to effective phaser range.

Ships C, D and E are short range siege phaser dreadnoughts. Ship C has strong forward arcs and speed so that the computer will hopefully rush in close enough to increase the effectiveness of its short range weapons. Ship D has high speed and a strong arc two so that the computer will hopefully spiral in to increase the effectiveness of its phasers. Ship E is very slow, but it has omni-directional weapons so maneuverability is less important. This ship will not be able to run away, but it should inflict a lot of damage on any pursuer. Ship C also has a plasma torpedo, as it is the only design which the computer will probably be able to bring to point blank range where plasmas are most effective. The computer is usually ineffective in using plasma torpedoes, as it tends to fire them at long range.

Continued on p.40

COSMIC BALANCE
STARSHIP DESIGN TOURNAMENT

Computer Gaming World announces its COSMIC BALANCE STARSHIP DESIGN TOURNAMENT. Design an unbeatable ship using Strategic Simulation’s COSMIC BALANCE and you can win a free SSI game of your choice. All entries must be received by CGW by April 30, 1983. In accord with the following tournament rules:

1. One entry per person. CGW reserves the right to publish descriptions of all entries. Your entry disk should be labelled with your name, address and telephone number. The disk envelop should be labelled with your name, address, phone number, either Apple or Atari, and each ship identified by a letter commencing with the letter “A” for your first ship, along with tech level. Include return postage if you want your disk back.

2. A panel of three or more judges will play each entry. Each judge will use a ship or ships consistent with the tournament rules. Your entry will be played by the computer at level two in solitaire play.

3. Each entry must be worth no more than 250 victory points. Each game will be played on Scenario Five: Dogfight. There can be no more than four ships per entry. Each ship must have a range of one, and no ship can have a maximum speed greater than 32. No dreadnought can have more than 12 drives.

4. Each entry will play each judge once. The difference between the entry’s and the judge’s victory points will be recorded at the end of the game. Each entry’s score differentials against all judges will be averaged. The entry with the highest average score differential will be declared the winner of the tournament.

5. After ten turns, if any entry warps out of retreats to a range of more than 100 from the judge’s ships, and if the judge’s ships do not pursue, then the entry will not receive full credit for any victory points recorded unless the entry suffered at least 25 percent damage; if the entry suffered less than 25 percent damage it will only receive half credit for any victory points recorded; if the entry suffered zero damage it will receive zero credit for any victory points recorded. The purpose of this rule is to discourage ship designs which immediately retreat from the judge’s ship or ships, because each game with such a design might last too long or might end in a stalemate if the judge decides not to pursue.

6. Send entries to COMPUTER GAMING WORLD, P.O. Box 4566, Anaheim, CA 92803-4566. Mark your package “Anaheim Ship Design Contest”

7. Winner will be announced in the July-Aug. 1983 issue.
1985 WAS NOT A VERY GOOD YEAR. THE RUSSIANS INVAD ED GERMANY, STORMED THE PERSIAN GULF, ATTACKED NORWAY, AND OVERRAN THE BALTIC.

INTRODUCING OUR NEW SERIES OF WARGAMES: WHEN SUPERPOWERS COLLIDE!

SSI has just turned the Cold War into a very hot one. We’ve produced an entire line of wargames under the title: WHEN SUPERPOWERS COLLIDE.* Each game in the series presents a different scenario of probable U.S.-Russia confrontations in various parts of the world.

The first four releases are GERMANY 1985, RDF *(in the Persian Gulf)*, NORWAY 1985, and BALTIC 1985.*

Designed by Roger Keating, creator of SSI’s highly-acclaimed SOUTHERN COMMAND,* these strategy simulations boast the same successful look and play as his previous masterpiece: beautiful color graphic displays, easy-to-use movement system and realistic combat rules.

In GERMANY 1985, battalions of Soviet infantry, tanks, artillery units, and paratroopers have breached the southern center of West Germany through the Fulda Gap. NATO forces must contain and repel the Red invasion.

We’ve introduced several innovative rules to this game: Speed of movement is inversely proportional to the number of enemy units that can see you; smoke screens can be called upon to help cover an attack or retreat; and the concepts of HQ units, divisional integrity, and air superiority are fully incorporated.

For improved playability, the computer can actually move and fire for you. For example, if you wish to move from point A to B, simply order the computer and it will move the designated units along the most efficient path — stopping whenever enemy units are encountered. Or you can have the computer direct your artillery fire for you. In the solitaire mode, the computer can play either the Soviet or U.S. side.

GERMANY 1985 (at $59.95) is more than the standard bearer for our new series. Its rulebook contains all the rules for the rest of the line... which are priced at just $34.95 each! What you’ve got are four great modern wargames at unbeatable prices!

To see how you can decide the outcome of battle when superpowers collide, look for GERMANY 1985* and company at your local game/computer store today!

*48K disc for the Apple II with Applesoft ROM card.
In ZORK I, The Great Underground Empire, you begin your adventure west of a great white house. From there you must explore and gain entrance to the underground empire. Points are gained by finding the twenty treasures and putting them into the trophy case. But, as you might expect, the treasures are not easily found. First, riddles must be answered, puzzles solved, and hazards (such as an axe wielding troll) overcome.

The most common hazards are the grues. Grues are carnivorous cave creatures that make meals of adventurers when the lights go out. Also, Zork I is inhabited by a thief who is apt to pick a fight, pick your pockets, or both.

In ZORK II, The Wizard of Frobozz, you begin in a Stone Barrow, already within the underground realm. You earn adventuring points by discovering treasures and by accomplishing difficult feats. As in Zork I, this usually means using the right objects in the right room in the right sequence. The consequence of failing to do so is death or frustration, or both. Zork II is inhabited by a prankster wizard who is obsessed with hexing you with spells that begin with the letter "F". Unlike the thief in Zork I, the wizard is more of a nuisance than an adversary.

In ZORK III, The Dungeon Master, your goals are to discover treasures and solve puzzles such as how to successfully operate the machinery in the technology room. The documentation for Zork III states that "...your quest hinges upon discovering the secret purpose of the Dungeon Master who will oversee your ultimate triumph — or destruction — in the realm of Zork." These words have left this adventurer truly puzzled. I achieved the total potential score (seven out of seven), yet I did nothing to make that game description make sense. So, there may be even more to Zork III than I've discovered.

Each adventure in the trilogy is different (and sold separately, by the way), yet each retains the same feel and flavor — like visiting three different towns in the same foreign country. Each adventure occurs at a definite point in time in the history of Zork. The adventures are pretty much independent, although I would recommend experiencing them in sequence.

The original Zork was developed over five years ago on a DEC System-10, inspired by the Crowthers and Woods original adventure: Colossal Cave. Zork I and II are based directly on the original Zork (with only a few changes and a few new predicaments). Zork III is, as far as I can tell, entirely new. More details on the history of the program's development can be found in these articles by the game's authors: "IEEE Computer", April 1979, and "Byte", December 1980. (Good reading if you're into adventure software design.)

Many features, besides its longevity and years of play-testing, come together to make Zork great. However, the one feature that makes it truly superior is its user-friendliness. Most of the user-friendliness can be attributed directly to the parser. A parser is the portion of an adventure computer program that analyzes your input and, if well done, responds appropriately. What this means to the adventurer, is that Zork allows you to enter commands not only as complete sentences, but as very complex complete sentences. For example:

TELL THE ROBOT "PUSH THE TRIANGULAR AND THE SQUARE BUTTON."

In other adventures, I sometimes knew what I wanted to do, but had to experiment with different combinations of two word (verb/subject) input to overcome the program's limitations. Not so with Zork. Virtually every one of my commands was understood.

To add to its adventurer-friendliness, Zork tries harder than any other adventure I've ever seen to do what is commanded. Consider this exchange (Zork's replies are in parenthesis):

OPEN THE DOOR
(Which door do you mean?)
TRAP
(Done.)

Notice that Zork discriminates between like objects (in this case, different doors) in the same location, and a single word of input is all it takes to get you going again.

If Zork makes an assumption about your command, it lets you know:

The Zork trilogy is a series of three enjoyable, exciting-to-experience, text-oriented adventures. Unfortunately, describing an adventure, without revealing clues, is like trying to describe a treasure chest without revealing clues. The consequence of failing to do so is death or frustration, or both. Zork II is inhabited by a prankster wizard who is obsessed with hexing you with spells that begin with the letter "F". Unlike the thief in Zork I, the wizard is more of a nuisance than an adversary.

In ZORK III, The Dungeon Master, your goals are to discover treasures and solve puzzles such as how to successfully operate the machinery in the technology room. The documentation for Zork III states that "...your quest hinges upon discovering the secret purpose of the Dungeon Master who will oversee your ultimate triumph — or destruction — in the realm of Zork." These words have left this adventurer truly puzzled. I achieved the total potential score (seven out of seven), yet I did nothing to make that game description make sense. So, there may be even more to Zork III than I've discovered.

Each adventure in the trilogy is different (and sold separately, by the way), yet each retains the same feel and flavor — like visiting three different towns in the same foreign country. To add to its adventurer-friendliness, Zork tries harder than any other adventure I've ever seen to do what is commanded. Consider this exchange (Zork's replies are in parenthesis):

OPEN THE DOOR
(Which door do you mean?)
TRAP
(Done.)

Notice that Zork discriminates between like objects (in this case, different doors) in the same location, and a single word of input is all it takes to get you going again.

If Zork makes an assumption about your command, it lets you know:
OFFER WATER
(To the Troll)
Adventuring is further facilitated by Zork's ability to recognize abbreviations and to accept multiple commands by recognizing commas, conjunctions (such as "and" and "but"), and periods. So, this command is valid:
N.NE.SE.DROP ALL BUT LAMP
ZORK recognizes the above abbreviations (for compass directions) and carries out your command. You can even ask "WHERE" and "WHAT" questions!
WHERE IS THE LAMP
(You are carrying it.)
Even though the Zork parser is state of the art, its not definitive. Due to space limitations, Zork sometimes does not recognize words that it uses in its colorful, detailed room descriptions. This is true despite the fact it does recognize over 600 nouns and 100 verbs.

As I mentioned above, Zork is all text—that means no graphics. None are needed. The authors have not skimped on the vividly detailed descriptions of each location; descriptions to which not even Atari graphics could do complete justice. For example:

SOUTH
Great Cavern
This is the center of the great cavern. A great room of flowing color has been carved out of the limestone.
Stalactites and stalagmites of many sizes are everywhere. The room glows with dim light provided by phosphorescent moss, and weird shadows move all around you. A narrow path winds among the stalagmites. There are many little trails leading in here and there, but a good one leads southwest toward the edge of the room, and another leads northwest.

These eloquent descriptions give their readers a real sense of the place. However, they are more than just flowery verbiage that takes up disk space. Often, clues to solving the mysteries of Zork are cleverly embedded in the prose.

Zork is like most other adventures in that it consists of many episodic plots (one episode, for example, being to acquire a particular treasure). You must do the routine things that all adventurers do: fight foes, explore room, find objects, and piece them together to solve puzzles that yield treasures (or points). As always, objects are seldom useful in the same room in which they are found (for example, don't count on finding a locked chest and a key that fits in the same room.) Usually the obstacles or riddles can be solved by logic or common-sense (like finding keys to doors). Occasionally, they are not-so-logical (like rubbing things not ordinarily rubbed).

The mechanics of testing your hypotheses about how to use objects or get past obstacles is nicely done. For starter, the Zork screen display is straight-forward. The text scrolls up (and off) and the top line displays your status: location (by room name), score, and number of turns taken. You always know where to look — either at the very top or the very bottom of the screen.

There are a host of special one-word commands to simplify and facilitate your adventuring: (would-be adventure software designers take note). For getting into and out of the adventure there's QUIT, RE-

PUBLISHER: EPYX (Automated Simulations, Inc.) Sunnyvale, CA

Not every Atari owner has a disk drive. Not every Atari owner has a tape drive. But we all have cartridge slots. This is one of the reasons that software publishers are, and will be, producing more games in cartridge format. But there is another reason that is more interesting for computer gamers.

Last year twice as many 400's were sold than 800's. That means if a software publisher produces a game that requires more than 16K RAM, he limits himself to about one third of his potential market (plus those people who have upgraded their 400's, of course). Not all of that 16K is available for the programmer's use, however. Hardware and operating system overhead requires memory; so do screens and/or custom character sets. While several very good games will fit into 16K, there are many that do not. Disk or cassette storage can only partly provide relief. Cassettes aren't random access, and even disk I/O time will take the pizazz out of an arcade game.

Cartridges become the great compromise. With up to 16K ROM added to the system with a cartridge, the amount of programmer usable memory is more than doubled. (Cartridge memory overlays RAM if you have at least 40K. 8K cartridges only overlay the last 8K of a 48K system.) That means that games that require 32K for a disk version, may require only 16K for the cartridge version.

The drawback is that cartridges are more expensive to manufacture than disks or cassettes, so the prices will be generally higher. Even so, 1983 is likely to be "The Year of the Cartridge". The larger market open to cartridge games means that there may soon be a glut of new cartridge titles.

Alien Garden is the first of three new cartridges from EPYX. In this game the player moves a "cosmic critter" through a garden of 24 flowers. At first all of the flowers are identical, but when the "critter's" mouth, wings, or stinger touches a flower, the flower will react in one of three ways:

1. The flower may grow.
2. The flower may "mutate" to the next generation of flower.
3. The flower may explode, eliminating that part of the critter.

The garden constantly scrolls vertically, reversing direction at the ends, or when any of the above reactions take place. If the player loses his mouth, the game ends. The wings and stinger will regenerate any time a new generation is introduced. The critter's mouth can eat the flower. If this happens the player scores one point for each part of the flower eaten, times the number of different generations in the garden.

While the patterns caused by "growth" are nicely done, the rest of the graphics are poor. What is particularly disappointing is the lack of color. Graphics zero (0) is used, with white on a black background. Some of the flowers are green or purple thru "artifacting". However, only four flowers can be on the same horizontal line. That means, if graphics one (1) or
Nightraiders

Fantastic action game for Atari*

The elite corps known as the Nightraiders are trying to bring freedom to a conquered earth. Since they are few in number, compared to the enemy, they must operate under the cloak of darkness. As the group's leader, your mission is to fly over enemy strongholds, identify targets of opportunity, and destroy them thoroughly.

While the invaders cannot mount an air attack after the sun has set, they do have weapons of awesome power... weapons which relentlessly track your flightpath and anticipate your movements.

Success does not come easy. You must be able to maneuver like the crack of a whip... accelerate and decelerate in and out of hyperdrive... while carefully lining up the targets for your twin ion bombs. And always keep an eye on the special radar screen which spots enemy action for you.

Become a Nightraider and meet the most fascinating challenge of your space career!

two (2) had been used instead, each generation could have been displayed using a different color. The critter is displayed using player/missile graphics, and since these have their own color registers, the critter didn’t have to also be white; but it is.

Alien Garden seems to be best categorized as a combination of arcade and memory games, although there is no way to adjust either the difficulty or the speed of play.

Plattermania is based on the juggler’s routine of balancing spinning plates on top of poles. At each level the players (up to four, taking turns) must keep spinning an increasing number of plates for at least eight seconds. Bonus points are awarded for more plates or more time. The player controls a clown that slides back and forth, starting or spinning the plates with a touch of the action button. Any plate that falls before the goal is reached counts against a supply of plates. When that supply is gone, the game is over.

During each round the number of plates left is displayed, the goal appearing during the interludes, which are nearly as long as the rounds of play. Since the same circus tune plays during each interlude, with no way to turn it off, this game seems aimed at children, but the children who played it for us got bored nearly as fast as the adults.

Monster Maze uses a somewhat familiar theme. The player (one only) wanders through a maze picking up gold bars that lie almost everywhere. There are monsters chasing you, but if you get one of the vitamin pills that are laying about, you can destroy them.

There are three major differences between Monster Maze and (surprise!) Pac-Man. First, the maze has 16 levels. Holes in the floor of one level, will drop the player, or monsters, down to the next. Second, the game is played from a point of view inside the maze. It is not strictly animated, as you jump to the next space. You can get an overhead view, but may not move while doing so. Third, the graphics are terrible. This game will also be available on the TRS-80, with no changes necessary in the maze graphics except background color. (The monsters in the Atari version use player graphics, and there is some sound effects.)

The speed of play is slow, even at the higher difficulty settings, and the monsters move more quickly while the player is moving than they do while he is standing still.

In all three of these games the ideas seem undeveloped and the implementation amateurish. Alien

ULTIMA II: A Review

James A. McPherson

You can stop holding your breath. ULTIMA II has finally arrived. Lord British’s sequel to ULTIMA continues the saga with enhanced detail and a larger universe.

This is an adventure across time and space that takes you from three-dimensional dungeons deep in the ground through time doors to the future and interplanetary trips throughout our solar system, plus more!

This colorful hi-res program has you traveling across a scrolling landscape of grasslands, mountains, and oceans with constantly moving waves.

The game resides on two disks with three sides of data. Along with the instruction book there is a cloth map of the world showing the approximate locations of the time doors. It is wise to read the instructions carefully.

THE QUEST

In Ultima I your quest was to destroy the archevil Mondain. At the time of his demise you might have thought that the adventure was finished. However, rumors have been spreading, and it is believed that before Mondain was rubbed-out he had been training an apprentice. The rumor continues by stating that this apprentice has grown even more powerful than Mondain and that the new evil spreading throughout the land is the result of this force. Your quest is to find and destroy MINAX, enchantress of evil, apprentice of Mondain.

IN THE BEGINNING

As in ULTIMA, you must create your character and play the game on a separate play disk; you only use the master disks for booting and going in to space. This does save wear and tear on the original disks.

To create your character you must distribute 90 points between the five attributes (strength, agility, charisma, wisdom, and intelligence), choose your sex, class, and profession.

In distributing points for attributes I concentrated on giving the most to agility and intelligence, recognizing that each attribute must have a minimum of 10 points. Agility is your skill at wielding a weapon and I wanted to be able to use the deadliest weapon as soon as I could. Intelligence increases your skills in bargaining and, more important, in the casting of spells. You learn quickly in the dungeons and towers how important this ability can be.

Strength determines the damage you can inflict on a foe in a fight. Stamina reflects your ability to defend against attack. Charisma governs your success in bargaining with merchants and Wisdom is what you need to cast spells successfully.

Once you begin play you will be able to increase your attributes as high as ninety-nine. This is not as easy as it sounds, nor is it inexpensive.

In your choice of sex (sorry folks, only male and female is available) you can increase certain attributes. A male character will increase your strength by ten and a female will increase your charisma by ten.

You then pick between five races and four professions: human, elven, dwarven, hobbit and fighter, clerici, wizard, thief. Each of these adds points to certain attributes.

There are also magic spells available to clerics and wizards. You have nine spells in three categories:

Spells both Clerics and Wizards can use:
1. Light—creates magical illumination
2. Ladder down—teleports you down one level in a tower or dungeon
3. Ladder up—teleports you straight up one level in a tower or dungeon

Cleric’s Spells:
4. Magic Missile—offensive magic weapon
5. Blink—randomly teleports you anywhere on the same level
6. Kill—attempts to obliterate your foe by magic

Wizard’s Spells:
7. Passwall—destroys the wall in front of you
8. Surface—teleports you immediately to the surface
9. Prayer—calls for divine intervention to destroy your foe

These spells are purchased in stores and can only be used in dungeons and towers. They are for killing and teleporting.

When your character is complete you are ready to explore Ultima II.

THE WORLD OF ULTIMA II

There are five time periods in Ultima II connected by time doors that appear off and on throughout the game. In order to be confident of your whereabouts these time doors should be mapped, which you can do with the aid of the cloth time map provided.

The time periods range from the predawn legends era to the post-apocalyptic A.D. 2112. Each period has unique locations and inhabitants to help or hinder you in your quest. You must talk or as they call it “transact” with everyone in the game otherwise you will miss some important clues, clues that are required to finish your quest. You may even meet someone you know.

Continued on p.45
“Ultima II is a universe of enchantment and challenge that draws you deeper into its unique spell with each playing. It will provide many hours, possibly months, of delight and enjoyment.”

SoftTalk, January 1983
"This game is arcade excitement at its best. On-Line has taken something genuinely exciting and added more. Rorke Weigandt and Eric Hammond, have packaged a genuine thrill-a-second arcade game."

Microcomputing Jan. '83

"More than enough to challenge even the best arcade!"

Creative Computing Jan. '83

"MARAUNDER is well done, and exhibits uncommon intelligence and realism in the enemy's tactics... You get your money's worth from MARAUNDER."

Peelings Dec. '82

Any arcade game can be fun the first 100 times you play it. It's the jewels that play 200... or 300... or 500 times. Marauder: "You get your money's worth" in a game that's more than enough to challenge even the best arcade! They said it, we believe it. So will you.

Marauder is available for Apple II/Ill + (48K) and Atari 400/800 (40K) for $34.95. Order from your local dealer or directly from: Sierra On-Line, Inc., Sierra On-Line Building, Coarsegold, CA 93814, (209) 683-6858.

---

Ever notice how many books there are about How to get rich in the stock market? Ever wonder why someone who had really gotten rich on the market needed to write a book? I know I have. I'm also glad that Jim Zuber didn't write a book. He took his experience on the stock market and used it to create a useful instrument with which to educate and entertain. MILLIONAIRE doesn't pretend to offer an esoteric system for making one's fortune, but it does have a marvelous capacity for introducing one to the basic mechanisms of the stock market. It doesn't offer the spurious potential of making a killing on the market that some fictionalized simulations do, nor the exotic gimmicks like selling short (see UNFAIR CRITICISM). It does, however, offer the user a chance to improve his/her investment sense through experience and increased options at each level of expertise. MILLIONAIRE is an exciting game, but its availability for business-oriented computers suggests its potential as a teaching tool, as well.

MILLIONAIRE enables one player to buy and sell fifteen different recognizable stocks in five different industry groups over the course of seventy-seven weeks of transactions. The computer creates ninety-one weeks of stock market environment and reveals thirteen weeks of history before the player is allowed to begin purchasing securities. Each week (game turn), the player will receive four basic tables of data prior to the "command mode" (where the player may research, buy or sell). These are: 1) Stock Market Graph (showing the overall market trend); 2) Industry Group Graph (one graph from one of the five groups, each week); 3) News (earnings reports, volume, industry trends, company announcements and news which may affect business); and 4) Market Report (changes in prices, high and lows, and average share changes on the market).

After this sequence, the player is free to do research (examine graphs of individual stocks or industry groups, review news reports, or peruse his portfolio); start a transaction (buy, sell or borrow); advance to the next week; or save the game. IMPORTANT NOTE ON SAVING THE GAME: though the program is capable of retaining the net worth and status of up to 14 players, the prodigious amount of data involved in each different market environment means that only one game can be saved at a time. This is not clearly stated in the original manual, but will be cleared up by a new manual which is now in preparation.

Each player begins play with $10,000 as a Novice and seeks to increase his net worth to the levels of $12,000 (Investor), $18,000 (Speculator), $40,000 (Professional), $100,000 (Broker) and, of course $1,000,000 (Millionaire). Each plateau adds new variables of strategy. For example, an Investor is able to buy on margin (borrow a percentage of the total purchase price of your stocks), while a Novice works on a strict cash basis. Once a player has achieved a net worth and status, the computer keeps it on record and the next game begins from that net worth. This enables up to 14 players to "compete" over a long period of time.

---

**SYSTEM DEFINITION**

(see CGW 2.5, p. 35)

In creating the simulation, the designer studied years of financial journals in order to determine the relationship of earnings, volume, news announcements, general and industry trends to specific stocks. The fifteen stocks were selected on the basis of their more or less typical behavior. In general, the research showed that there are three basic variables which work together at an approximately equivalent weight. These are: 1) the overall stock market picture (Bear - , Bull +, or Mixed); 2) the industry group (one graph from one of the five groups, each week); 3) News (earnings reports, volume, industry trends, company announcements and news which may affect business); and 4) Market Report (changes in prices, high and lows, and average share changes on the market).

The documentation noted that earnings reports are often discounted (Wall Street-ese for "ignored") and that volume can indicate either big gains or big
losses. Therefore, the change probabilities are based on the three major indicators noted above.

There are, according to the designer, approximately $15^{21}$ possible combinations of stock prices alone and an equivalent number of possibilities for the general market and industry trends, as well. The fact that these probabilities influence each other indicates a very satisfying "continuous" probability system as opposed to the strict "discrete" probability of boardgames and less sophisticated programs (see CGW 2.6, p. 16 for further information). This enables the player to use realistic strategies in playing the game.

**STRATEGY NOTES**

Pay attention to news! Every news event has effect on a given stock and often on an entire industry group. For example, a technology innovation by IBM will usually indicate a swift rise in IBM prices for the next week or two and often has a derivative effect on CONTROL DATA and NCR, as well. In my games, hard times for BENDIX (Auto Industry Group) is a significant signal for me to unload GENERAL MOTORS or AMERICAN MOTORS, as well.

Pay attention to trends! Since the trends of the market in general, industry group and stock in particular are given equivalent weight in the probability matrix, it is highly unlikely that a stock will rise when its own industry group and the market in general are declining. I can testify that this is a realistic feature, having owned hotel stock during the 1974-'75 Bear Market due to the Arab Oil Embargo. My company had increased earnings and real growth and expansion, but couldn't buck the trends.

Discount earnings! Very rarely does an earnings report cause a significant change in the real stock market prices.
market. This is, perhaps, because there are numerous ways to "hide" actual earnings in corporate expansion, depreciation, new acquisitions and tax shelters. Therefore, very rarely do they affect the stocks within the parameters of the game.

Dollar cost averaging! In spite of the obvious educational opportunities to be gleaned from this program, it is, after all, also a game. Now, whereas I might want to sit out of the real market for a time, I usually want to get into a game as fast as I can. That can be fatal in MILLONAIRE, because it faithfully creates some realistic Bear markets. What can be done?

One strategy is dollar cost averaging. This means to buy stock in small quantities on a regular basis instead of one large quantity all at once. Many people eschew this strategy because you have more brokerage fees, but it is successfully used in real life by small investors through the New York Stock Exchange's Monthly Investment Program (MIP). The theory is that 100 shares of stock at $10 each needs to appreciate $2 per share for the investor to make 20% on the investment. However, 200 shares of stock at $5 each only needs to appreciate $1 per share for me to make 20% on my investment.

How does that help me make money during a bear market? First, I select what I believe to be a sound stock (for example, EXXON). I buy 10 shares of EXXON at $60 per share ($600 invested) and it starts to go down in price. Some weeks later, I spend $600 more to buy EXXON at $40 per share. I now have 25 shares and have spent $1200 (plus commissions of course). If I had just held on to the first 10 shares, the price would have to reach $56 per share for me to make 10%. However, by buying on the down trend, my average cost on 25 shares is $48 per share and the stock only needs to recover to $52.80 instead of $56 in order for me to make 10%. I keep buying the stock at regular intervals and bring the break-even point down. This way, I can be in the market without worrying about whether it has actually hit bottom or not. This enables me to "play" the market on the downside while continually minimizing my risk (assuming the stock is sound enough to ever actually recover). The "dollar cost averager" won't make phenomenal amounts of money, but if he selects sound investments, he should make consistent profits.

Be careful with options! When a player reaches the level of Speculator ($18,000), he is eligible to use CALL options. A CALL option anticipates a significant rise in a stock, so it provides for the investor to be able to purchase the stock at a slightly higher price (the STRIKING price) at a later date. This assumes that there will be a much higher purchase price on the stock at the later date and thus, the investor makes money on the difference in value. Since options are much less expensive than stock, the investor stands to make significantly more money if he is correct than he would with the full purchase price of the stock at stake. When a player reaches the Professional ($40,000), he may use PUT options. A PUT option anticipates a significant decline in the stock, so it provides for selling the stock at a slightly lower price (the STRIKING price). This means that the difference between the much lower price and the slightly lower STRIKING price (if the investor is correct) is the potential profit.

Since options are a time valued mechanism, recognize that values of options usually drop as they near their expiration dates. This means, of course, that one should only invest in options on stocks where there is an expectation of significant fluctuation in the relatively near future. For example, it would be foolish to be hedging against a Bear market using "dollar cost averaging" and then invest in CALL Options on the same or related stock. As the manual notes, it is possible to see the stock make a moderate gain and still have the player lose money on the option because the expiration date is so near.

UNFAIR CRITICISM

It has been suggested by some gamers experience with the other "stock market games now on the market, that the game suffers from a missing mechanism. Many who are new to the strategies of investments are disappointed because the possibility of "selling short" is not available in the simulation. This is undoubtedly because "selling short" (selling stock on credit that you don't actually have) an exotic strategy which depends on a very hefty line of credit. It seems superfluous to a market which has PUT options. If the investor feels a stock is headed for a certain decline, he stands to make much more money by playing the less expensive PUT options (which enables him to option for more total shares) than taking the riverboat gamble of "selling short" on the expensive market value of stock itself.

WISHFUL THINKING DEPARTMENT

Because of the enormous amount of data to be saved for each game environment and the problem with saving more than one game, I wish that the program allowed for saving onto a separate disk, similar to several other programs. This would make wonderful use of the potential for 14 players to use the program and compete against each other on a continuous basis.

I also wish that more than one player could buy and sell in the same market. My profits and high score in a Bull market may be very poor compared to a friend's moderate gains and relatively low score in a bear market. The only way we can actually compete is to work in the same "game time" frame. I realize this would probably entail using both a game disk and data disk, but it would be worth it.

Continued on p.40
THE GALAXY AWAITS YOUR COMMAND.

When SSI introduced THE COSMIC BALANCE™, it was hailed as one of the finest tactical space game ever made. It not only gave you starship combat that was fun, fast and furious, it also let you design your ships. You became both starfleet commander and starship architect.

Now we are proud to present its strategic-level sequel — THE COSMIC BALANCE II™. It allows all you aspiring Galactic Emperors out there to plot the growth of your space kingdom — from a few, paltry planets to the entire Galaxy! You discover and colonize planets, establish commerce nets, organize production of necessities, and send starships out on missions. There are five scenarios prepared for you, but you are free to create your own.

No matter how you play it, THE COSMIC BALANCE II™ is a game of interstellar conquest. And the only way you're going to enlarge your share of the cosmic pie is to win starship battles against your opponent (which can be a human or the computer).

When actual combat occurs, you can let the computer resolve it instantly. Or you can slug it out in all its blazing glory by using THE COSMIC BALANCE™. The battle outcome can then be incorporated into the strategic game.

Space may be what these games are all about, but there isn't enough of it here to adequately describe them. But why read when the Universe beckons? Plot a course to the nearest computer/game store and get these games today! You have a destiny to fulfill — a destiny that lies out there among the stars.

ON DISC FOR THE APPLE AND ATARI™

THE COSMIC BALANCE &
THE COSMIC BALANCE II ($39.95 each) are on
48K diskette for the Apple II+ or Apple II with Applesoft ROM Card. Also on 48K disk for the Atari 400/800.

Once a robot is on the battlefield the actions of his creation. He must anticipate, in the design stage, the possible situations in which his robot might find itself and program accordingly, making the game great for learning computer logic. Most robotwar designs are the end product of months of refinements.

**THE ROBOTS**

**ARC MAN** — entered by Bill Logsdon of Tulsa, Ok. Arc Man travels in a wide clockwise circle, varying his right hand turns according to the distance from the walls. Arc Man uses a vector movement routine based on "a two term Taylor's approximation of the sine function".

**AROUND** — another entry by Bill Logsdon. Around goes around the outer perimeter of the arena in a counter-clockwise manner. In effect it becomes a bottom robot, then a side, then a top, etc.

**BOTTOM** — A fill-in robot from the original game. Bottom goes to the bottom of the playing field then travels back and forth scanning upward and firing at any robots he sees.

**CORNER** — entered by David A. Jones of Tulsa, Ok. Corner heads for a corner position (usually the upper left) and, in that tuck position, can maximize his scan and firepower by reducing the area to be covered to a 90 degree arch. When damaged, Corner steps out of the corner momentarily to minimize damage from repeat fire. Corner watches closely for "edge" robots making their way toward him (the bane of any corner-type robot).

**DIAMOND** — Another Bill Logsdon entry. Diamond remains stationary until damaged. When hit he high-tails it to another wall at an angle with the overall pattern looking like a diamond. He has a high speed tracking routine that can destroy center moving robots.

**GRAVE** — entered by Robert Hogg (Doug Hogg's 8 year old son who programmed it himself, although Doug wrote down some code for him). Grave goes back and forth across the top firing downward. He will stop when he sees a side robot directly below him and fires continually until the other robot moves or dies.

**NORDEN B** — entered by Richard Fowell of Palos Verdes Estates. A refined version of last year's winner. NORDEN B has a very effective tracking algorithm and is impressive at hitting robots while moving a high speeds. Norden B waits a short time to allow side and corner robots to clear the center then begins an elliptical movement pattern that changes when hit.

**DRAGON** — the tournament winner by Doug Hogg of Los Angeles, circles the screen just off the edge efficiently strafing robots along the side. He will also, in some situations scan the middle and attack center-type robots. The secret in Robotwar is to survive. Points are awarded for surviving rather than for killing. If a robot can avoid getting damaged he will win regardless of whether he inflicts a great deal of damage (let the other guys slug it out, I'll just stay here out of the way and win). This design philosophy has a flaw however. Obviously some firepower is needed, for eventually only two robots will be left in a battle. A passive robot is then doomed. Dragon is a robot that is designed to minimize damage. And, even though his firepower is not as effective as Norden B, or Corner, he does pack enough punch to take out an opponent. His pattern, just off the edge makes him less likely to be damaged. He won't collide with the edge or corner robots, and is far enough from the center to avoid direct run-ins with center robots.

**HOT ROD** — A bottom robot that travels left and right shooting upward even if no target is detected. It checks both to the right and left for other bottom robots and will fire at same until death of one or the other. The random shots are more effective than one might expect. When a robot is spotted fire is very accurate.

**JAWS** — Another entry by 8 year old Robert Hogg. Jaws makes his way to the bottom center of the field. Where he is effective in hitting center robots such as Norden.

**MOVER** — A fill-in robot that moves when he is hit. It search 360 degrees.

**DRAGON** — the tournament winner by Doug Hogg of Los Angeles, circles the screen just off the edge efficiently strafing robots along the side. He will also, in some situations scan the middle and attack center-type robots. The secret in Robotwar is to survive. Points are awarded for surviving rather than for killing. If a robot can avoid getting damaged he will win regardless of whether he inflicts a great deal of damage (let the other guys slug it out, I'll just stay here out of the way and win). This design philosophy has a flaw however. Obviously some firepower is needed, for eventually only two robots will be left in a battle. A passive robot is then doomed. Dragon is a robot that is designed to minimize damage. And, even though his firepower is not as effective as Norden B, or Corner, he does pack enough punch to take out an opponent. His pattern, just off the edge makes him less likely to be damaged. He won't collide with the edge or corner robots, and is far enough from the center to avoid direct run-ins with center robots.

**JAWS** — Another entry by 8 year old Robert Hogg. Jaws makes his way to the bottom center of the field. Where he is effective in hitting center robots such as Norden.

**MOVER** — A fill-in robot that moves when he is hit. It search 360 degrees.

**NORDEN B** — entered by Richard Fowell of Palos Verdes Estates. A refined version of last year's winner. NORDEN B has a very effective tracking algorithm and is impressive at hitting robots while moving a high speeds. Norden B waits a short time to allow side and corner robots to clear the center then begins an elliptical movement pattern that changes when hit.
STANDINGS AFTER ROUND ROBIN

1. HOT ROD (58 pts.)
   NORDEN B (58)
3. DRAGON (48)
   ZIG ZAG (48)
5. CORNER (47)
   ARC MAN (47)

7. AROUND (44)
9. MOVER (37)
10. JAWS (35)

11. DIAMOND (31)
12. WILDMAN (29)
13. THOR II (24)
14. BOTTOM (23)
15. RANDOM (17)

THE FINALS (25 Battles)

1. DRAGON 67 pts.
2. CORNER 50
3. HOT ROD 49
5. ZIG ZAG 35

RANDOM — Another fill-in robot. Random moves in a random fashion firing if he sees another robot.

THOR II — entered by David Meredith of Merrimack, NH. Thor II is corner robot who heads for the nearest corner. He often lost on slug-outs with “Corner”.

WILDMAN — entered by Neal Buck of Tulsa, OK. The editor’s favorite (for it’s colorful nature, certainly not for it’s ability to win). Wildman is a 100% offensive robot (his victims certainly thought he was offensive). When he spots another robot he charges pell-mell after it firing all the way. Robots on the move could escape his tracking about two thirds of the time, but the other one third of the time they were in for real trouble. Robots that did not move—died. Unfortunately for Wildman, his offensive nature was his own demise as he had no damage checking routine which caused him to walk into certain death more often than not.

ZIGZAG — entered by Algis Seskus of Broken Arrow, OK. Zigzag moves in a zig-zag fashion searching three times on each leg of the zig-zag.

THE CONTEST

All robots competed in a round robin in which each contestant robot faced each other contestant an equal number of times (24 battles for each robot). The top 5 robots entered the finals. There was a tie for the fifth position between Corner and Arc Man. Corner won the best of 7 playoff to go to the finals. The finalists fought 25 battles against one another with DRAGON coming out comfortably on top. Congratulations to DRAGON and it’s designer Doug Hogg!

ROBOTWAR DISK OFFER

Can’t find an opponent for your ROBOTWAR creations? Want to find out how to make better robot designs? Looking for new blood? Then you will want to get CGW’s Robotwar diskette.

CGW’s Robotwar Diskette contains the source code for all entrants from our Second Annual Robotwar Tournament (with the exception of Norden B) including the winner DRAGON. The disk also includes last year’s winner, NORDEN+. Twelve robots in all.

To order send a check for $10.00 to COMPUTER GAMING WORLD, P.O. BOX 4566, ANAHEIM, CA 92803-4566. California residents add 6% sales tax. Allow 2-3 weeks for delivery. ROBOTWAR is a trademark of Muse Software. Robotwar runs on an Apple II with 48K and Applesoft in ROM.
The arcade-warp is open!
YOU CAN RUN BUT CAN'T HIDE. YOU CAN KILL BUT CAN'T ESCAPE.

Tubeway! It’s an insidious invasion route created by beings from a parallel universe—a strange, geometric universe. You’re trapped on the rim as their fleet swarms out of the warp on a voyage of conquest. The battle is yours alone—and it’s far from easy because normal strategy doesn’t work! . . . you have to fight by their strange, geometric rules!

Here’s the fastest, most fascinating of the new style space games. So involving and exciting it’s destined to become an all-star, all-time hit. Be one of the first to take on the challenge of the lightfast Tubeway!

Listen To The Mockingboard:
Sound & Speech For The Apple II

Thomas Cleaver

You sit down before your computer and boot your new game disk. A wizard materializes on the screen, accompanied by a clap of thunder from your eighty watt stereo sound system. The mage points a bony finger at you and asks in a voice like the rustle of dry leaves, "Do you dare accompany me to the Lair of the White Worm?" You answer in a quavering voice, "Yes, my liege. Lead on." And the adventure begins.

What's this? Games that talk? And respond to spoken English? Well, yes and no. The above game is still a dream, and it will not be a reality until further hardware and software advances are made.

Speech recognition by computers is still in its infancy. Some progress has been made in speaker-dependent voice recognition, but you have to train the computer to understand your voice, and massive amounts of memory are required just to recognize a few words. Speaker-independent voice recognition, which would be required for the game described above, is still at least ten years away from being practical.

But computer speech is here today. Sparked by Texas Instruments research into linear predictive coding (LPC), as used in Speak-and-Spell, and Votrax research in phoneme synthesis, there are now several speech peripherals that can be purchased for personal computers. The Mockingboard is one of them.

The Mockingboard Sound/Speech I plugs into any of the peripheral slots of the Apple II. It has two separate outputs which can be plugged into a stereo system or directly into speakers. I have found that the signals are quite strong, so that direct connection to speakers gives plenty of volume. One of the outputs provides sound effects, and the other provides synthesized speech. Both outputs have volume controls. The board retails for $299 (talk is not cheap).

SOUND EFFECTS

You may ask, "Why do we need special sound effects hardware when we can get all the sound effects we need through the Apple's built-in speaker?" The things that have been done in sound generation within the Apple are truly amazing. The typical Joe Computer-freak doesn't realize the contortions a programmer has to go through to get a specific sound from Apple's crummy little speaker. He must write his code in machine language, and he is limited to doing but two things: pushing the speaker cone out and pulling it back in; therefore he must make each sound by "bit-banging" — driving the speaker cone in or out at precisely spaced times. And worst of all, he must "integrate" the sound effects with the rest of the program. For example in an arcade game program the programmer must move an object on the screen, bang the speaker, check to see if a key has been pressed, bang the speaker, check for object collisions on the screen, bang the speaker, etc. I have the greatest respect for the Budge's and Gebelli's who can make all this sound and motion seem so smooth.

Special sound effects hardware, such as is available in the Atari and the Commodore 64, make this programming task much easier. You just set up the sounds you want, start it running, then go back to your display and operations program. This sort of thing is possible in the Apple only by use of additional hardware, such as the Mockingboard, plugged into a peripheral slot.

The sound effects channel in the Mockingboard is based on the General Instrument AY-3-8910 Programmable Sound Generator chip. It contains three tone generators, a noise generator, a mixer, and an envelope generator. The frequencies of the three tones can be very finely controlled so that, for example, a three-note chord could be produced. The noise generator can be used to produce sounds like gun-shots and explosions. The envelope generator provides various amplitude modulation schemes for the sounds: for example, a rising and falling amplitude with noise as the input will produce a sound like waves on a beach.

Sweet Micro Systems, the manufacturer of the Mockingboard, provides a demo diskette to show off the sound effects. They include bomb, laser, pump, helicopter, train, and several others. They are all fairly well done, but they aren't much better than could be expected from speaker bit-banging. The disk also contains a music routine, which is a bit better. It uses the Apple keyboard as a piano.

There was no software which showed how to program the sound generator chip, how to edit sound effects, or how to use the capabilities of the board in your own programs. There weren't even any useful comment statements in the demo programs.

To make matters worse, the accompanying documentation was of little help in this respect. The instructions for developing custom sound effects were sketchy, at best, and were directed to the machine language programmer. A BASIC programmer would be S.O.L. if he tried to use this manual. By fooling around in machine language I was able to make a few rudimentary sound effects, but I quickly determined that a sound effects editor was a minimum software requirement.

SPEECH EFFECTS

The speech channel of the Mockingboard is based on the Votrax SC-01 Speech Synthesizer chip. It uses
beep
In the beginning ...

beep was all you heard
Not a Princess cried. No thunder clapped.
Bombs didn't explode and doors didn't slam.
Villains were silent and aliens were too. The
Wizards were speechless and that wouldn't do.

Now there is
MOCKINGBOARD™
You no longer have to imagine the roar of the
crowd or the magical voices of extra-
terrestrials or your favorite song. What you
once imagined can now be heard.

Experience all the moans, the
music and the magic from

This month we'll look at four Apple games suitable for pre-schoolers. When reviewing software for young children, I pay particular attention to three factors. Let's look at these first to set some guidelines.

First is simplicity. It's confusing to have to press the escape key in one place, the return key in another, and the spacebar in a third. Better to have one key serve the same function everywhere. This is an important factor in what the ads call "user-friendliness". I call it simple common sense. Adults cope better with poor design since they can read instructions on the screen. For non-readers, the program must be kept simple enough that they can remember what to do. This usually means a menu — to remind you what is available and to simplify (one keystroke) the process of getting there. Clever use of pictures and graphics can help too.

Another important aspect of software for kids is error-trapping. This is the ability of the program to ignore or recover when you do something wrong. Children often like to try something just to see what happens; this is the primary way they learn about the world. Sometimes they experiment within the context of the program (and any good game for kids should allow this), sometimes they'll experiment outside — like hitting the \texttt{RESET} key "just for fun". This curiosity is good; if you discourage it in any way, you discourage learning. And a program that has to be re-booted is certainly discouraging. When testing these games I tried as many "experiments" as I could. I also gave them to the kids with encouragement to try anything that wouldn't damage the disks.

My children (one is six and one eleven) and their friends also help me evaluate the third important aspect of these games: longevity. By this, I simply mean how long any one child will stay interested in it. That natural curiosity mentioned above will cause them to play ANY game once. There is a tendency, though, to grow bored with a game before the skills involved are truly mastered unless there is something that motivates them to keep playing. It has to be enjoyable and stay enjoyable. This means you shouldn't do or say anything which suggests failure.

Let's start with the game designed with the youngest "users" in mind. This would be \texttt{JUGGLES' RAINBOW} from The Learning Company. It uses brightly-colored rainbows, butterflies and windmills plus lots of music and will even keep infants entertained. It requires no reading skills, anyone who can recognize the numbers from 1 to 3 can use it without help. Option four on the menu, the question mark, is a configuration screen that lets anyone who \texttt{CAN read} turn off the sound or the picture clues (thus forcing the player to read the wordclues). Once you select a number, you don't have to hit any specific key. The keyboard is divided into banks of keys to teach the concepts of left, right, above, and below. You can divide the keys with a strip of yarn or paper — blue is best since the program uses a blue bar to divide the screen.

When your child begins to learn the alphabet, consider getting \texttt{BOP-A-BET}. This is a maze game where you steer a boxing glove using four keys. You bop...
letters in alphabetical order by pushing the space bar and if you bop them out of sequence nothing happens. The object is to bop as many as you can within a time limit. When you boot the disk, there are some questions that let you change the time limit, the speed of the bopper, the keys used, and choose upper or lower case. This part requires an older person who can read but once started, four and five year-olds will have no trouble.

**MICRO MOTHER GOOSE** will also entertain infants. It allows you to select one of nine nursery rhymes; it plays each tune while the words and some animated graphics appear on the screen. The menu (only half is shown) is well done — it has a distinctive symbol alongside the words so that non-readers can use the game once they get familiar with it. Many children will know some of these rhymes, so seeing the words on the screen may help in learning to read. However, only the very young (with no concept of reading) want to see the rhymes more than once, what older kids want to do is play the three arcade games which are also part of this package. These games are based on themes from nursery rhymes and require paddles. The simplest is *Lamb Scram*, where you help Mary get three lambs through a hole in the hedge before the Big Bad Wolf gets them. Then you have *Splat!,* wherein you catch eggs as they fall off a wall. Finally you have *London Bridge-out,* which is our old friend *Breakout* (or Brick-out) in new clothes. Although much simpler than other versions of this game, it is still the most difficult of the three. These games are well done and should provide kids in the three to six group with lots of fun — unless older kids are playing something else, in which case the younger crowd will want to play the same thing.

The last game we'll look at this month is **SPELLING BEE GAMES** from Edu-Ware. This is a set of four games which share a common vocabulary and theme — each of the words is represented graphically by a hi-res picture. The games are *Squadron*, *Skyhook*, *Puzzle*, and *Convoy*. *Squadron* requires two players and paddles; each player flies an airplane to "shoot down" the word that matches the picture at the bottom. The other three games are all for one to four players. In *Skyhook*, you see a picture and some scrambled letters; you use the paddle to control a helicopter to pick up letters and put them in the right place to spell the word. In *Puzzle*, you get a few seconds to memorize six pictures before they are concealed; players then take turns guessing where the picture was that goes with the word at the bottom. *Convoy* is a truck race in which a picture appears at the top of the screen and players take turns typing the next letter in the word; each correct guess moves your truck forward a little. Note, that *Convoy* is the only game that requires you to hit the actual keys for each letter. There is a configuration module which can be reached by pressing a "secret" key from the menu. It allows parents or teachers to select the vocabulary units used. There are 22 units on the disk; they begin with simple two and three letter words and get more complex, up to a third or fourth grade level.

In terms of simplicity, three of these four games can be used by the age groups for which they were intended. BOP-A-BET would also qualify except for those questions at the start which set up the game. However, you also have to ask yourself if your children (or students) can be entrusted with the only copy of a $30 to $40 disk.

Of the four, only **MICRO MOTHER GOOSE** is copyable. The good people at Software Productions even provide a label for your extra copy, which impressed me more than the posters and stickers that also came with it. A back-up copy of JUGGLES' RAINBOW is available by mail for $12. This is much less convenient, but reasonable compared to those that are copy-protected and offer no backup at all! That hardly seems appropriate for software aimed at children.

All of these games seem immune to inaccurate keypressing, although three of them have done nothing about the RESET key. In JUGGLES' RAINBOW, the RESET key restarts the current module, in the other three it reboots the disk. This may not be much of a problem with late-model Apples, since they can be set up so that CTRL and RESET must be pushed at the same time, but owners of earlier Apples will have to give special training or physically protect the RESET key.

Of this month's four games, **SPELLING BEE GAMES** is the only one that the play-test group asks for now that testing is finished. Of course, this is due in part to their average age level, which is too old to be enthralled by nursery rhymes, but it is also a credit to the graphics since the kids ask for it (sometimes) instead of any of the arcade games we have so far. It is an excellent example of the motivational value of games because it is similar to, but much more popular than, Edu-Ware's **SPELLING BEE AND READING PRIMER** which doesn't use the game format.

The following abbreviations are used in the SYSTEM requirements: P- paddles, J- joystick, 3.3- =DOS 3.3, 5.25- =DOS 5.25

Whenever an Apple II+ is specified, an Apple II with Applesoft in ROM may be used.
Its time again for another issue of Microcomputer Mathemagic. First of all, did you find a winning strategy for the game of FIFTY? For those of you tuning in for the first time (where have you been?), this game is played by two players who alternate turns in picking a number. In each case, the players choose from 1, 2, 3, 4, 5, and 6 and a running tally is kept. First player to make the tally hit 50 wins.

In the last issue of CGW I gave one computer listing of a program which allows one to play against either a human or computer opponent. Recall that the computer opponent plays first and the program prompts for whether you wish it to play somewhat randomly or completely logically. (In the latter case, the computer is unbeatable, as you will see momentarily from a discussion of strategy).

If you played enough, you should have discovered that whoever goes first has a natural advantage in the game, but this is not obvious at first. In fact, when people first play, they usually pick numbers randomly for the first few turns. When the tally hits the thirties, the action slows down as the players begin to think: "What should I pick now?".

This leads the player to examining his optimum situations. When the tally is getting close to around 40, you would like to have the total be 43 (which is 7 less than 50, please note) after your turn. Why 43, you ask? Well, the opponent has to pick at least 1 and at most 6. If he picks 1, the total becomes 44 and you can pick 6 on your next turn to win. On the other hand, the most he can pick is 6, for a total of 49 after his turn, so he can’t win. You can probably see now that no matter what he picks, you can then win.

Okay, so what about the previous turn? Well, by the same kind of reasoning, you would like the tally to be 36, which is 7 less than 43. Why? So then no matter what your opponent picks, you can make the total after that turn become 43. Specifically, if he picks x, then you pick 7-x. (If he picks 1, you pick 6; if he picks 2, then you pick 5, etc.)

If you trace this argument backwards, subtracting more and more multiples of 7, you will find this to be the unique winning strategy.

Whoever goes first can always win by first picking 1, and thereafter, whenever your opponent picks x, you pick 7-x on the immediately following turn. This insures that at the end of your turns the running totals are 1, then 8, then 15, then 22, then 29, 36, 43 and finally, 50.

**TYPICAL GAME IN WHICH COMPUTER (#1) WINS BY THE STRATEGY (TRS-80 VERSION)**

I still invite readers to consider the questions raised last issue. For instance, what happens if you alter the game to include fewer choices, such as only being able to choose 2, 3, 4, 5 each time; or playing for more points; or making the choice of numbers vary each turn. (You could let players choose 1 or 2 only second turn; 1, 2, 3, or 4 on their third on their turn, and so on). The possibilities are quite endless, and I would be glad to hear from readers about interesting variations.

One other thing that I would like to see are superior programs. These might be programs which have better error catching routines, superior displays, etc. In fact, I wonder how many readers noticed my goof in the Microcomputer Mathemagic column #1 (Vol. 2, #6) in which both program listings have prompts "Press any key to continue" instead of what I should have had, "Press ENTER to continue". (I was confusing INKEYS with INPUT at the time, evidently).

In a similar vein, surely some reader can provide a nicer display than the one I gave for FIFTY last issue. The problem is to make a program applicable to and compatible with most major brands of computers. The original program used the "print @" command for the TRS-80 to obtain a nice display. Unfortunately, this command is not supported by other computers (although Apples and some others have comparable commands. I have been told), so I had to provide what I could. Okay, enough about style for now...Let's look at something new!

**THE MacDONalD’S PERMUTED CHANGE PROBLEM**

Last issue I mentioned that I would like to provide something of a programming challenge, and this is it. First, the problem itself and its history. Approximately seven years ago, while still living in New York City, I went into a McDonald’s restaurant and noticed the following interesting incident. I ordered a meal that cost $1.85. I handed the counter person a ten dollar bill, and noticed that my change, $8.15, had the same exact digits as the price. This led me to the question: Are there other prices (other than $1.85 or $8.15) whose change from $10.00 contains the exact same digits as the price itself?

My challenge to you is to write a BASIC program to find all such prices. Send these to me and I will publish the best ones a few issues down the road.

Next issue I will have some new goodies for you. In the meantime, send all your comments, questions, suggestions, and so on to me directly:

For personal replies, which I will be pleased to make, it would help if you would enclose a self-addressed stamped envelope.

Dr. Michael W. Ecker is Assistant Professor of Mathematics at the Pennsylvania State University, the Worthington Scranton Campus, in the Scranton, PA, area. His ambition is to be able to say that he is Associate Professor of Mathematics at the Pennsylvania State University in the Scranton, PA, area.
**EPIDEMIC: “An Apple (or PC) a day...”**

**DAY 1**

Meteorites impacted last night in the United States, Scandinavia, India, triggering raging epidemics of a strange alien disease in each region.

Disease rate in the US is the lowest of the three, at 2.4 on the 1 to 5 scale, with 5 indicating Pneumonic Level. We’ve hit Scandinavia and India with Gamma Globulin treatments.

**DAY 2**

Over 88 Million dead worldwide. Epidemic in the US now 2.7 and rising. Scandinavia Gamma Globulin effectiveness is below average, death rate stable. Indian epidemic is at stasis, and so will not spread or escalate—a good buffer zone.

Today we instituted a 5-day “clean suit” policy in the US. Effects should be felt immediately to some effect and strongly within 2 to 3 days.

**DAY 3**

US clean suits totally ineffective! The virus is too small and goes right thru the filter units...worst of all, the US HAS infected Canada!

In Scandinavia, the Gamma Globulin treatments are having only miniscule effect...and we can’t recall the mobile teams in less than two more days! They’re dying like flies! ETA of the Pneumonic Level in THREE DAYS!! The only bright point is that India has been cured!

**DAY 6**

This epidemic is getting out of hand! US entered Pneumonic Phase, 145 million dead, and the disease has spread to Central America. Western Europe and China both getting worse, and the Soviet Delegate is calling for Nuclear Sterilization of North America.

**DAY 7**

Greenland, Eastern Europe, and the Soviet Union now infected!! Mass panic spreading worldwide as total deaths approach one billion. Anti-Pneumonic Remedy #4 failed in US, total destruction of all sentient life in that region expected in three days!!

**DAY 9**

We haven’t got a chance...the epidemic is too widespread...we’ve tried everything...too late...feel feverish...can’t think clearly...why are there green and purple spots on my hands?...can anyone out there hear me?!

Thus ended my first attempt at Level Four, the easiest level of SSIs New introductory strategy game Epidemic. The world is broken down into fourteen geographical regions which are menaced by a swarm of meteors carrying the deadly alien microbes which, on its last swing thru this part of space, wiped out the dinosaurs!!

Each turn you’ll view a world status update, telling you how many have died in each area, how long before the regional epidemic reaches Pneumonic Phase (becomes airborne and even more deadly), and whether the infection level is rising or falling.

This update helps you formulate your overall strategy, after which you’ll get a radar update (showing locations of approaching meteorites) and finally a world map update with a menu allowing you to obtain detailed regional information, to initiate attempted cures and/or fire missiles at incoming meteorites, and even to nuke areas that are too far gone.

Unfortunately, you have a very limited number of actions per turn. At levels 4 and 3 (the two easiest) you have only two options per turn, while at level 2 and 1 (the hardest) you have three options per turn. This often leads to conflicts between whether to treat an already infected area or launch a missile at an incoming “target” to try and prevent additional regional infections.

Your primary strategy should be to create stasis zones (infection level between 1.0 and 2.0) which will prevent the spread of the epidemic to other regions. If a region slips past stasis and is fully cured, you may regret it very quickly when that region becomes reinfected and you have to start all over again.

The best cure you have is Interferon. Unfortunately, you only have one day’s supply of Interferon per epidemic per region, and you just can’t be everywhere at once. All remedies except Interferon last for more than one day — two to five days is the range — and each has its own effectiveness curve.

The catch is that any given remedy can be more or less effective than anticipated, and once you start something, it has to run its course before you can try another remedy. For example, in the game described above, when the “clean suits” in the US were...
COSMIC BALANCE (Cont.)

For ship to ship combat between dreadnoughts, the following generalities should be useful in designing new ships. A high technology ship is usually stronger than more numerous lower technology ships. Crew skill is useful in designing dreadnoughts, the following generalities should be useful:

- Extra power engines as you will need the extra power to repair shields and to run a plasma (if you can afford it) to destroy armor. Give your ship extra engines as you will need the extra power to repair shields and to change course when you take damage. You should have about five to ten marine detachments on board as insurance against transport ships like Ship B. You don't need many because one surviving crew or marine detachment can operate the ship. You should have about 12 to 16 belts as insurance against shields. Discretion really is the better part of valor. Even the immortal John Paul Jones once said, “Give me a fast ship, for I intend to sail in harm’s way!” Good luck and good hunting!

INDUSTRY NEWS (Cont.)

Blue Chip Software (see the review of Millionaire in this issue) has announced a new commodity market simulation—TYCOON. TYCOON will allow players to engage in complex trading of futures contracts in gold, soybeans, Treasury bills, foreign currency, pork bellies and other commodities. It will be released first for the IBM-PC and followed by versions for the Apple, CPM and CPM 86. The simulation will retail at $79.95 for the Apple version and $99.95 for the other versions.

PDI (Program Design, Inc.) has announced that they have moved their headquarters. The new address is: 92 East Putnam Ave., Greenwich, CT06830.

There are four new releases from Avant-Garde Creations for the IBM PC: AIR TRAFFIC CONTROLLER, TERRA JEOPARDY, FEDERATION, and LAZER MAZE. All four games retail for $29.95 and all but the first require the Color Graphics Adapter.

Coming soon from Sirius Software is the hi-res adventure game THE BLADE OF BLACKPOOLE ($59.95).

Strategic Simulations has moved. Their new address is 96 East Putnam Ave., Greenwich, CT06830. Strategic Simulations has moved. Their new address is 96 East Putnam Ave., Greenwich, CT06830.

SII has released the long awaited revised version of COMPUTER AMBUSH. They have also released their Battle of Britain game, FIGHTER COMMAND. Both run on the Apple II. SII will have a number of April releases. RAPID DEPLOYMENT FORCE—1985 which is the second release in the "When Superpowers Collide" series (Apple); NORTH ATLANTIC—1986 by Gary Grigsby (Apple); KNIGHTS OF THE DESERT which covers the North African Campaign in WWII. KOTD will run on the Apple, TRS-80, and Atari (joystick control in the Atari version). Other April releases will be COSMIC BALANCE 2: THE STRATEGIC GAME for the Apple and Atari; GALACTIC GLADIATORS for the IBM-PC and the Atari.

SUMMARY (Cont.)

MILLIONAIRE is a stimulating experience for anyone who enjoys the strategic decisions inherent in high finance. Its system definition, based on careful research and continuous probability, makes the game both realistic and fascinating. The levels of expertise and their varied options, along with the potential for different market environments, give the game an assured longevity in the strategy gamer's library.

ATARI ARENA (Cont.)

Garden, for instance, takes over a minute to begin, and must be rebooted to start with a new garden. None of the games have a pause command. None of them record a high score.

The standards for cartridge games have been established by games like Star Raiders and Missile Command. Broderbund is bringing out at least Choplifter and Serpent in cartridge form. Synapse plans to release all their games in cartridge, with Shamus already available. Against competition such as that, any company producing cartridge software is going to have to come up with solid, professional products if they want to compete.

Have you heard? Atari is bringing out an expanded Eastern Front on a cartridge. The year is going to get better.
Blackjack lovers this is it! With Championship Blackjack from PC Software you can play under realistic conditions using the rules from all the gambling funspots. Before going into the details, a rundown of the features and playing options available with Championship Blackjack should be enough to convince you, as it did me, that it is an outstanding blackjack software package which is even better than the hard-wired setups you put your quarters into at the casino while you're waiting in line to see a dinner show.

The game options include:

- All allowable plays are supported, including stand, hit, double, split, resplit, insurance, and surrender;
- Single or multiple decks;
- Tournament and double exposure play;
- Choice of casino rules, including Vegas Strip, Vegas Downtown, Atlantic City, Tahoe, and Reno;
- Ability to set your own rules;
- Julian Braun's Basic and Point-Count System strategies.

The game features include:

- Monochrome and color displays, with sound;
- Menu-driven screens;
- Player statistics;
- Simulations.

The game is so complete that about all you can't do is order cocktails and look at the dealer's eyes when he checks for blackjack.

The game will accommodate up to six players and any of these can be played by the computer itself. Players automatically have their moves checked against the basic strategy developed by Julian Braun and, additionally, player's moves can also be checked against Braun's Point-Count system. Poor decisions based upon these systems, are then indicated by appropriate messages.

The general flow of the game is as expected. Cards are shuffled, bets are placed, hands are dealt, and players make their decisions. What makes this game an excellent instructional tool, is that at the upper left of the screen, the program displays the running count, the true count (since you can't actually see the shoe to see how many decks are left), the recommended move using basic strategy, and the recommended move using the Point-Count system. And, if you still can't make up your mind, there is a help screen available to show you all the options.

I played the game on an IBM monochrome display and found the graphics to be excellent. The screen layout is similar to that green felt on a blackjack table. Cards are dealt face-up, down cards down, and hits and splits are neatly overlapped. Player's names, their current bankroll, and current bets are always displayed at their respective places on the table. The statistics screen is very helpful and lets you know at any time how everyone is faring, this is most important in tournament play and when running simulations.

The only recommendation I have for the developers of the game is an added feature that will allow practice drills on such things as soft-standing rules, soft-hitting rules, pair splitting decisions, double down decisions, and surrender decisions.

If you are a beginning blackjack player, a hearty welcome to the game. You won't find a more helpful and enjoyable way of learning than Championship Blackjack. If you're an expert, counter, tournament player, or professional, you will find Championship Blackjack to be an outstanding computer game.

Good luck, and see you at the tables!

Jim Zegers

Jim Zegers
avoid oncoming traffic (red and white cells). The technician takes care of repairs, keeps track of inventory, and fires the laser, when appropriate, while viewing a stunning display out the front window of the sub. The physician monitors the patient and prescribes drugs and other treatment.

All of the above is accomplished in real time while frantically consulting manuals, reading the radar scope, taking blood tests, etc. And it’s fun! But also, it’s educational. Anyone who plays this game can’t help but learn some anatomy, physiology, and pharmacology. I have been exposed to plenty of programs that claimed to be educational games, but this is the ONLY one that succeeds.

MICROBE is designed to work with VOTRAX, ECHO, and MOCKINGBOARD speech products. My version runs with the Mockingboard, which adds special sound effects and a talking computer. I like these features in MICROBE, but I’d like the game even without them.

I thoroughly recommend MICROBE to gamers of every stripe for the enjoyment it provides, and I recommend it to everyone else for its educational content.

Tom Cleaver

**Riverside, CA**
ST2 is a nice little game. Controls are user-definable key-
chase games have been overused, the strategy I found is to concentrate on fin-
touches, and works like a real sonor scope. Two indica-
the submarine's speed, damage indicators, amount of air left, battery charge, position of the submarine relative to the sea bottom, and a game clock.

The second screen is the Sonar Scope. It looks, sounds, and works like a real sonar scope. Two indicators are added to this screen: tonnage sunk and Hydrophone Chart. The Hydrophone shows the player which direction to steer to intercept the convoy.

The third screen is the most important. This is the periscope view. This is where all the action takes place. This screen shows clouds, water, and the ships. As the ships enter the view, they're black shapes. The closer they get the more detailed they become. When torpedoes are fired they appear on screen and move toward the target. A 3D effect is achieved with your torpedoes receding in the distance. When a torpedo strikes a ship, the water billows up in the explosion with excellent sound effects as the ship slowly begins to sink. Ships can also fire back as evidenced by flashes and sounds of their guns. If the sub takes a hit, the whole screen shakes.

There is one minor problem in the game. Moving the submarine, especially in the heat of battle is difficult to grasp. The sub doesn't turn as fast as the player wants. This slows down the action, but once the player gets used to it, it isn't that noticeable.

The game is in real time using the joystick and keyboard. There are nine levels of play with ships on levels seven thru nine possibly requiring two hits to sink. There are four types of ships: destroyers, tankers, cargo, and PT boats.

The game ends when the sub runs out of fuel, air, sinks, or the battery charge is depleted; while scoring is based on the length of the game the tonnage sunk, and the amount of fuel used. The user manual is very good, covering all aspects of the game. This game will appeal to those who like arcade graphics and sounds, but enjoy a sense of wargaming.

Hosea Battles

ON VACATION
Silicon Cerebrum and Route 80 are on vacation. Look for them again next issue.

Anthony Melendez
what units will move first. Unit one enemy zone of control to
Moving into an enemy unit's zone of control (rigid zone-of-control).
they stop, but are not obliged to
an enemy unit's zone of control
current turn. When units move into
supply condition, rated effective-
designation, combat strength,
capabilities are displayed during
committed to that move. A cycle of
once a move is made the player is
units cannot stack together, and
are unsupplied receive deleterious
effects to movement, combat, and
fatigue ratings. General allocation
of available Allied amphibious
transport occurs once every turn
(two days), and such allocation
must choose between differing
percentages of amphibious (unit
transport), combat supply, general
supply, and fuel. Beachhead units
are quite vulnerable to attack, and
their loss will result in a shut-down of
that beachhead with a diminution of
general amphibious transport
capabilities.

The amphibious assaults in the
first turn will require one or two
divisions to be landed for each
beach defense to be cleared.
Beachhead units automatically land
first, followed by airborne landings
and ground units during the first
turn. As the invasion and build-up
continues, depot units can extend
the line of supply two hexes from
beachheads.

The menu presents a one or two-
player option, along with options for
variable Allied and German
strengths in air and naval firepower,
transport capabilities, reinforcement
times, leadership and combat
ratings, and the ability of the
Germans to move the first day.
An average move takes about ten to
fifteen minutes, with about two to
three minutes used by the computer
in the solitaire version of play for
resolution of German movement and
combat. The sequence of play
is traditional — the Allies move and
then attack then Germans move and
attack, and finally the end of
turn results are displayed (with a
save game option).

As a historical simulation, BFN is a
great improvement over Tigers in The Snow.
The Normandy campaign
is sufficiently well documented to
provide correct orders of battle for
the level of units presented (regi-
ments, brigades, and divisions).
Once again, as in Tigers, regiments
and brigades cannot stack together
or move through the same hex at
the same time. This last element, in
BFN is a contradiction of well-
established unit frontages for the
period. Nevertheless, this game is a
generally good representation of the
Normandy landings and build-
up.

The time used in the computer's
moves is a dramatic improvement
upon earlier SSI titles, having a
minimum of "dead time" as the
computer moves units and deter-
mines combat. No option is pre-
sented, unfortunately, for checking
at the end of a movement phase to
do double-check with the player for
acceptance of that turn's move-
ment. Overall, Battle for Normandy
is an enjoyable game that will allow
multiple playings and repeated
playings with equal satisfaction.

NAME: Battle for Normandy
TYPE: Wargame
SYSTEM: Apple, Atari 400/800,
TRS-80
FORMAT: Disk or Tape
# PLAYERS: 1 or 2
PRICE: $39.95
PUBLISHER: Strategic Simulations
Mountain View, CA

SSI's Battle for Normandy (BFN),
continues the design and develop-
ment tradition of Tigers In The Snow
with additional refinements. Cover-
ing the initial Normandy landing
through the build-up prior to
Operation Cobra, the game takes
14 turns (June 6 through June 30) in
two day increments. Included are
air and naval firepower capabilities,
weather and logistical consid-
erations. The game can be played
with two players or solitaire with the
computer acting as the "German"
player.

The regimental and brigade-sized
units cannot stack together, and
once a move is made the player is
committed to that move. A cycle of
rotation through available units for
movement continues five times in
order to select the sequence of
what units will move first. Unit
capabilities are displayed during
movement and combat, showing
designation, combat strength,
leadership and fatigue ratings,
supply condition, rated effective-
tess, terrain stacked on, and
movement factors left during the
current turn. When units move into
an enemy unit's zone of control
they stop, but are not obliged to
attack (rigid zone-of-control).
Moving into an enemy unit's zone of
control consumes four movement
points unless moving directly from
one enemy zone of control to
another, which consumes eight
movement points.

Units must remain within two
hexes of a depot unit or beachhead
hex to remain supplied. Units that
are unsupplied receive deleterious

NAME: Space Strike
TYPE: Arcade
SYSTEM: IBM PC, 64K, color
graphics adapter
FORMAT: Disk
# PLAYERS: 1
AUTHOR: Michael Abrash
PRICE: $29.95
PUBLISHER: Datamost, Inc.
Chatsworth, CA

SPACE STRIKE is a Space Invaders
type game for the IBM-PC. As one
would expect, the object is to stop
the aliens who march across the
screen from reaching the bottom or
from destroying your space tank
(gun). Points are given for hitting
the alien saucers which travel quickly
across the screen from time to time.
High scores are saved to disk.

The strong points of the game
include the option of using either
keyboard or joystick. Using the
keyboard is quite cumbersome and
not suggested if you want to achieve
any reasonable score. This is not the
fault of the programmer, but is
generally the rule for any arcade
game where agility is needed. The
author, however, has made it pos-
ible for you to change the playing
keys so that you can select the ones
that are the most convenient. You
also have the option to turn the
sound off and to freeze the game in
progress.

SPACE STRIKE is a simple but
effective game of Space invaders.
Graphic quality for the aliens, space
creatures and missiles is fair. The
graphics displayed when an alien
ship is hit is first rate. The accom-
panying sounds add to the effect.
When hit, the alien spacecraft
fragments into many discernable
pieces which gently float down the
screen. The destruction of your
space tank is also finely illustrated.
Once hit, your craft fragments into a
mass of tiny pieces as it is strewn
about the screen.

In conclusion, SPACE STRIKE is a
new name for an old game. This
doesn't change the fact that it is a
well programmed, error-free game.
It is recommended to those who are
looking for a good quality invaders
program.

Mark Lacine
ULTIMA II (Cont.)

As you travel through the time periods you will visit villages, cities, castles, dungeons, and towns where you can purchase food, spells, transportation, armour, and weapons. You can even stop in at the local tavern to have a drink and hear the local gossip or bribe the barkeep for a hint.

You also have an entire solar system to explore with each planet having its own features and towns to visit. You might even discover the whereabouts of the mysterious Planet X.

SUGGESTIONS

Your first quest upon entering ULTIMA II is to safely make your way to the nearest settlement to arm yourself against the nastier inhabitants that roam the world. You also must not forget to make sure you have enough food to last for awhile. Otherwise you can die if you’re too far from a village and can’t get back in time for food. I found this out the hard way.

I spent a lot of time the first few tries making new player disks until I was able to get close to the water and board a frigate. (You need “something” in your possession to be able to board the frigate but it is obtained by doing battle with the inhabitants and should not take long.) It is difficult staying alive until a frigate appears. However, once on the frigate you patrol the shores of the continents and attack the Orcs, Devils, and Balcons with the ship’s guns. You will find that you lose little or no hit points during the battle and it doesn’t take long to build up your inventory of gold, possessions, and experience points. The best time period for this is the Pangea.

When you initially travel through the time doors you end up being stranded on one continent until a frigate ventured close. This sometimes took a while and I was determined to find a solution to this lack of transportation. Once you are on a frigate you can get other frigates. Instead of firing on hostile frigates, head for land and dock your frigate. Then board the hostile frigate. It will become friendly. You now have two frigates. In this manner any number of frigates can be docked by the different time doors. This can be very helpful to you as you travel about.

When you press the “Z” key you are shown the status of your character attributes, experience points, and inventory. You have to keep a careful watch on five items, but four of these items deserve special attention. They are attributes, torches, keys, and tools. You are allowed to have 99 of each but go just one point above and the total resets to zero. It’s not healthy to have any one of your attributes go to zero. Let alone having to lose keys that are very hard to come across. Experience points were very important in ULTIMA I and you strive to increase them but in ULTIMA II they are not important and if you get above 9999 the counter will just reset to zero.

There are dungeons and towers which are similar in detail to other popular games but are not really necessary areas to explore to win the game. However, I did enjoy mapping the levels and there were definitely new twists added that I have not experienced in other dungeon-type games. It is very expensive to reach the highest floor in a tower or the lowest level in a dungeon.

Remember to visit all time zones and planets. Transact with everyone you can, it is very easy to let the most important contact slip through your fingers if you are not careful.

There is one weapon you need before you can effectively attack Minax and that is the magical quicksword ENILNO. The instructions say you cannot buy it, you must earn it. I had to buy it.

You use a lot of money in ULTIMA II trying to get information so it is wise to know where and how to get restocked quickly.

My copy of Ultima II was one of the first off the production line. When you first build your character you are allowed to spread 90 points between the five attributes. If you didn’t give at least 30 points to strength it turned out you were not able to wear the reflector or power armor. Without the reflector suit you could not venture out into space. I was lucky and gave my character 30 points initially and never saw that problem. Although I never was able to wear the power suit which would have made me less vulnerable to hits. This has been corrected by Sierra On-line.

The game has a nice feature in that it automatically saves your character at certain points in the game. Even this did not help me in one instance. I had ventured out into space with very little food and was unable to get close to a village to buy food without dying. At this point in the game my character had been very strong and I was able to travel throughout the time periods without too much trouble because of the possessions and vehicles I had accumulated. I hated to even think that I would have to start over. I found a partial solution for anybody who gets in this predicament. Start a new character on a new disk and build him up so he has about 5000 hit points and the same amount in gold. Somewhere in this new game remove your new disk and put your old disk into the drive. Press Q to save. The computer will save your new character on your old disk. You will then still have use of whatever frigates, planes, or shuttles that your previous character used. I do not know if this will work in all instances and I recommend it only as a last resort, it did save me a lot of time.

One thing you learn quickly while piloting a shuttle is that you only have one chance to land. If you do not land on grass you die, no exceptions. The shuttle will continue to circle every planet until you press a key so it is wise to allow it to initially circle every new planet once before you land so that you know what you are getting into.

When you first get into combat you start acquiring items that you have no idea what they are used for. You usually end up finding out the hard way so watch your cursor every chance you have during battle for hints.

One of the most difficult item(s) to find and obtain are the keys. Let me just say that the initial few are costly but there are ways to use these first few to build up more than you will need.

CONCLUSION

The world of ULTIMA II is vastly improved over ULTIMA I. The villages, castles, and towns are all unique; the oceans and lakes even have animated water. My only thought as I finished the game was that very little of this enormous work was really utilized as being required to complete the game. It was almost as if this was only a small initial quest to give you the lay of the land and that additional scenarios would be released, each one using more of the game until the “Ultimate” quest was finished. Therefore I was not surprised at the little ad that appeared at the bottom of my screen at the completion of this quest. It said that…
START, RESTORE, AND SAVE (with up to five different saves). For controlling the amount of detail given in room descriptions there's BRIEF, SUPERBRIEF, AND VERBOSE. And, for making a printed transcript of your adventure there's SCRIPT AND UNSCRIPT to turn a printer control on and off.

Even the running problem of every adventurer — getting killed — is handled with finesse. Instead of forcing you to start over at square one (perhaps with a re-boot), Zork, in most cases, scatters your possessions and reincarnates you near where you began the adventure.

So that I don't lose my reviewer's license, or my credibility, I guess I should mention a few of Zork's shortcomings. The trouble is that for a game of its type Zork has no serious flaws. If Zork does have a flaw, it is that the empire is, perhaps, a bit too fanciful — it lacks an internally consistent theme. For example, Zork I contains, among other things, an Egyptian Tomb room, a troll room, a Flood Control Dam with electrical power, and the Gates of Hades. Don't get me wrong, these places are exciting to discover, explore, and relieve of their treasures; but what are they doing in the same world? Of course, not all adventurers would agree with me that "organic unity" is important, or even relevant.

There is one other feature of Zork that I almost considered a flaw, but am now not so sure. Unlike a well-made play, or a well-written short story, in which all pieces must move the plot forward or contribute to the whole, Zork has a few, but just a few, puzzles that either don't have solutions or that don't need to be solved to reach the adventure's conclusion successfully. I can't decide whether these puzzles are supposed to be red-herrings or cliff hangers.

Zork is currently available on several computers, which explains, in part, the existence of an organization called the Zork User's Group (Z.U.G.): an independent company licensed by Infocom. Z.U.G. provides (sells) such paraphernalia as clue booklets, guidemaps, a full color poster of Zork I (to commemorate your visit) and even souvenir buttons. Z.U.G. gives (and I repeat) a special caution, that their guidemaps reveal locations and items that an adventurer may want to discover for himself. With that in mind, I didn't look at my Zork I guidemap until I was confident I had fully mapped out everything. I must admit I took special delight in comparing the accuracy of my map (consisting of several sheets of yellowed paper, Scotch-taped together) with the official one (nicely drawn and printed, of course).

Zork is vast and intricate. I counted over 100 interconnecting rooms in Zork I alone. This means that map making is imperative. Examine everything. Remember that, especially in mazes, there are ten different directions (eight compass directions, plus up and down). Also, don't hesitate to re-explore old paths. Occasionally, new passages open up as you solve mysteries, or as events outside your control (like earthquakes) occur. Finally, even though Zork is a single-player adventure, don't go there alone if you can help it. It is definitely an adventure to be shared and enjoyed.

EPIDEMIC (Cont.)

completely ineffective, I still had to wait out the five full days of the attempted cure. Which meant five days of unhindered growth!

Once a region hits P-Phase (Pneumonic level) your options change from the eight standard cures to the four Anti-Pneumonic Remedies (APR's). Each of these has a different percent chance of success, but the effectiveness of the remedy is inversely related to its chance of working successfully. For example, APR 4 has only a 20% chance of actually working, but if it does, the disease level will be reduced by 80%. Conversely, APR 1 has an 80% chance of working, and if it does, the disease level will be reduced by 60%.

My feeling is that unless it is a last ditch effort, APR 1 is the way to go. Two successful applications of APR 1 will cure an area, while any non-functional APR will only waste your turn option and let the disease run merrily along its course.

The ultimate solution is to nuke a region. As might be expected, this will destroy all the microbes in the region. It also has the rather unpleasant side effect of destroying all other life in the region as well, but it will stop the spread of the disease. Be careful about nuking the US, USSR, and Europe, though, since these areas control the missiles which are your only chance to stop the incoming meteors. If you lose your high-tech areas, the effectiveness of your missiles will plummet.

The only negative I found was that at level one, the tracking of eight individual radar targets (incoming meteors) was slightly tedious. I don't have any suggestions as to how to streamline this, and the additional meteors do increase difficulty, but I got tired of waiting out this phase at this level. Also, if we could somehow have been presented with a parameter variation option, that would have been nice. Perhaps we could vary the number of meteors, increase or decrease the growth and spread of disease, or move our command post from region to region where it might be susceptible to the disease.

In conclusion, Epidemic is a good beginning level strategy game with excellent graphics. The game provides a real challenge to constantly better your score by curing the world as fast as you can. It is easy to learn and highly addictive. My brother, a pure arcade player, came over for Christmas dinner and played four full games of Epidemic before, during, and after the holiday feast.

R.I.D. #7 (Instructions on pg. 48)

GAMES

1. Wizardry (Sir-tech)
2. Knight of Diamonds (Sir-tech)
3. Guadalcanal Campaign (SSI)
4. Ultima II (On-Line)

24. Galactic Adventures (SSI)
25. Marauder (On-Line)
26. Bomb Alley (SSI)
27. Ulysses (On-Line)

Continued on p.47
used almost four thousand variables to simulate 36 offenses against 24 defenses. However, the original version did not sell anywhere near my expectations. The most reliable advice I received admitted that the

**MOCKINGBOARD (Cont.)**

phonemes. 64 of them, to create continuous speech. Phonemes are fundamental speech sounds which can be strung together to form words. A typical five-letter word may contain ten phonemes.

The demo diskette has a very limited vocabulary. It speaks one sentence and a few unconnected words. The speech is easily understandable, but it sounds very mechanical. The Cylons in Battlestar Galactica were opera singers in comparison. But it was speech. My computer was talking!

There was no software to help the programmer create his own words, and an examination of the BASIC code for the demos provided no help. The documentation was good enough so that a determined machine language programmer, such as myself, could use it to produce spoken words. I had a fine time making the computer insult anyone who happened to be around.

**THE MANUFACTURER RESPONDS**

My work with the Mockingboard generated several questions which I was not able to answer. So I called Sweet Micro Systems to get them. Mr. Rod Nakamoto, the designer of the board, spoke to me. He said that a utility disk was in preparation which would contain a sound effects editor, a phoneme editor, and a method for saving phoneme strings. This disk will be included free with the Mockingboard, and those that have already bought the Mockingboard will also be eligible to receive the disk free. This answers much of my criticism of the software and documentation included with the board, but I have not reviewed this promised utility diskette, and I therefore cannot attest to its quality.

Another product which is available for the Mockingboard, and which the manufacturer was kind enough to send me, is the Text to Speech Algorithm diskette ($39.95). It will allow you to put English words into BASIC statements so that the computer will say them. It works very well, however words have to be spelled phonetically (spell chemistry with a K).

**BUT WHAT ABOUT GAMES?**

If you are into games, but not into programming, you may not care about producing your own speech or sound effects. You want to improve your gaming experience by adding speech and better sound effects. But you don't spend a lot of money on hardware that the game companies aren't going to support with software. It's too soon to tell yet if the Mockingboard will be well supported with game software, but at this writing two games are already out: MICROBE, by Synergistic Software, which is reviewed elsewhere in this issue, and THUNDERBOMBS by Penguin. Sweet Micro Systems reports that the following games, soon to be released, will use the Mockingboard:

- Tactical Armor Assault (Avalon Hill)
- Crime Wave (Penguin).

**BUT SHOULD I BUY IT?**

The Mockingboard is for you if:

A) You are a gamer who can't wait to have your computer start talking.

B) You are a machine language programmer who wants to fool around with voice synthesis and sound effects.

C) You are writing user-friendly special purpose computer software which would be significantly enhanced by providing user instructions in spoken English, e.g., an automated bank teller.

The Mockingboard Sound/Speech I is available in many computer stores, or it can be ordered directly from Sweet Micro Systems, 150 Chestnut Street, Providence, RI 02903, for $299 + $2.50 shipping.

C. Other Comments
There were 169 R.I.D.s turned in by press time for this issue. The breakdown of users was: Apple (58%); Atari (33%); Others (9%). The mean score for RID #6 was 6.83 (our highest average yet). The scores of games evaluated in RID #6 were reduced by .46 to adjust them to the overall mean of 6.37 that has been adopted for RID score comparisons. The scores for RID #6 have been incorporated in the overall rating table below.

GAME RATINGS

The following table includes all games evaluated by our readers since May 1982. For a game to be included in this listing it must first have been offered for rating in our regular RID rating system. Games offered for evaluation are those covered in the magazine and/or have a good sales record during the time of evaluation. Once offered for evaluation the game must have been evaluated by a sufficient number of readers to be included in the results. Any game not evaluated by at least 20% of the respondents owning the machine that the game runs on were not included in the results.

Games were rated on a scale of 1 (terrible) to 9 (outstanding). Respondents were asked to consider such things as PRESENTATION (graphics, sound, packaging, documentation); GAME DESIGN (design, playability, interesting?); Life (does the game wear well?).

R.I.D. #7 (Use card provided)

On page 46 a number of games and articles are listed for evaluation. Please take time to evaluate these games and articles. Use the guidelines above for game evaluation. Leave blank any game which you have not played enough to have formed an opinion.

</table>
THE ALIEN—Just you, your crew, and the stars are trapped with THE ALIEN, a creature of unknown powers loose on board a space exploration laboratory. The Alien, besides the name of the game, is a deadly foe and will metamorphose to more and more deadly forms as time goes on, so it is imperative to subdue it as soon as possible. Beautiful high-resolution graphics give you a tour of the planet's research vessel, the U.F.P. Thrusts. Victory depends on clever planning and careful thought.

CLOSE ASSAULT—Advanced wargame of tactical infantry combat. Russian, German, and American forces are represented in this WWII simulation which blends the allure of computerization with tabletop gaming. CLOSE ASSAULT permits original scenario development or pre-programmed ones. Features include the hidden movement, solitaire or two player option, morale factors, and most unique, a game system that actually tells you control squad level units in life-like situations.

VORRAK—The Vorakian orbital fortress beckons YOU! Harm sunlight glistens off your datorium as your destroye fighter blasts off into heroic destiny or total destruction. VORRAK is a fast-paced arcade game simulating a small jet fighters attempt to penetrate stalacite and stalagmite—like obstacles enroute to a gigantic power emerald carved out from a massive asteroid. You are of the Chi Dronican heritage and your people have selected you to pierce all deadly defenses to destroy the power emerald. The last flicker of freedom around Chi Dronican rests on your shoulders.

GYPSY—It's a JUNGLE OUT THERE! Here you are a happy-go-lucky bug in the garden of your dreams perched high upon a piasmic Qok tree sampling the nectar of your delight. Beware you are not the only one who considers this paradise their home. There's the infamous Flying Ant of Tasmania, the fierce windozoo Bee and the brittle spider webst with nasty stings and bites that will drain your energy reserves. You have to maneuver GYPSY through the leafy mazes of the Qok tree eluding these and other perils.

FLYING ACE—In FLYING ACE you play the part of a World War One bi-plane pilot, your mission attack and destroy the enemy trucks carrying ammunition to the front lines. You control your plane much like an actual aircraft. Loop to loops, climbs, and dives are all essential maneuvers you must master as squadrons of enemy planes will continually "dogfight" as you become airborne. Commodore 64 cartridge available later this spring.

BREAKTHRU (in 3-D)—Fast-action, three-dimensional, high-resolution, machine language, arcade game. But BREAKTHRU is more than a mere game; it's like racquetball will be played someday in space! Realistic graphics and sound produce an exciting simulation of motion and perspective. BREAKTHRU is as much fun to watch as it is to play. The object is to knock out five consecutive walls at the opposite end of the (racketball) court using a joystick paddle to strike or deflect the lively ball. Watch for the Atari VCS 2600 cartridge version available later this spring.

SPACE STATION ZULU—Humorous strategy game of space station defense. You take the role of the captain of Space Station Zulu, directing your crew of peace loving 'Yargis' against an endangering concentration of larva-stage lifeforms. To combat these big, ugly, and slimy creatures the 'Yargis have a number of weapons at hand: laser guns, fire torches, ice bottles, and grenades to name a few. Trying to stop the ever-growing alien population makes for great fun on board Space Station Zulu.
